## 2 Overview

### 2.1 Overview devices

This manual refers to the following devices (order number in bold).

- AZI-0316.03 Switch Actuator 3 channel, 4 SU MDRC, 16/20 A, 230 V AC, with active power meter, $200 \mu \mathrm{~F}$
- AZI-0616.03 Switch Actuator 6 channel, 8 SU MDRC, 16/20 A, 230 V AC, with active power meter, $200 \mu \mathrm{~F}$

### 2.2 Functions

## Active power measurement

The active power can be output per channel and as the sum of all channels in watts or kilowatts. Load exceedances and load undercuts can be evaluated and (delayed) execute a switch function or a scene. The extended power measurement offers an additional object per channel, selectable from apparent power (VA/kVA), reactive power (Var/kVar) or the power factor $(\cos \varphi)$. The measured values can be sent cyclically and at an adjustable minimum change.

## Current measurement

The current value can be output per channel and as a total current in milliamperes or amperes. Exceeding and undercut of the current value can be monitored per channel and in total and actions can be triggered as a result. The output object of the monitoring can be "Switch" or "Scene". Actions can be delayed on activation and on withdrawal. Cyclical sending of the monitoring can be activated.

## Voltage measurement

The voltage is output per channel as a 4 Byte object. Exceeding and undercut of the voltage can be monitored and actions can be triggered as a result. The output object of the monitoring can be "Switch" or "Scene". Actions can be delayed on activation and on withdrawal. Cyclical sending of the monitoring can be activated.

## Energy and cost meter

The electricity prices for day and night required for cost calculation can be entered either fixed via the ETS or variable via objects. The currently valid electricity price is output per object. The meter readings can be output separately for day and night. The energy meters of the channels can be written to via their object. Intermediate meters with selectable datapoint types (Wh or kWh ) can be activated for each channel and for the total meter.

## Events

Up to two events can be activated in each meter. An event is triggered as soon as a selected condition is met. The condition can be a reached value of a (main) meter, certain costs of a (main) meter, a time or an interval. The triggered event then performs functions such as sending and/or resetting a counter reading.

## Error messages

If a load failure occurs when the contact is closed, or if a fault current occurs when the contact is open, this can be signalled by means of a 1 Bit object.

## Switch function

Separate settings for each channel allow, for example, operation as a normally closed or normally open contact, with a switch-on and/or switch-off delay. The status of each channel can be sent cyclically if required. An additional - inverted - status object can be activated.

## Threshold function

With the threshold function, for example, the channel can be switched when a temperature or brightness is reached. Various actions can be set for exceeding/undercutting of the threshold value.

## Pulse function

Short switching pulses are used, for example, to open or close garage doors. The pulse duration is adjustable and pulses can be repeated once for certain applications.

## Extended staircase light function

By pressing the push-button several times, the time in the switch actuator can be added up and the staircase lighting can remain switched on longer as required. Staircase lighting times can be set differently per floor using a 1 Byte object. The prewarning can flash the button LEDs via an object, for example. An actuator channel with staircase lighting function can be used in parallel as a switch channel by means of an additionally activatable switch object.

## Extended logic and scene function

The extended logic function links the channel with up to two further logic inputs. AND, OR, XOR and gate functions are available for selection. The logic inputs can be inverted as desired and set to a defined value after bus voltage recovery. This prevents undesired behaviour after a restart. The extended scene function can lock or unlock in addition to switching on or off. Furthermore, saved scenes are retained when the application is reprogrammed.

## Operating hours meter

The actuator has an operating hours meter for each channel, which can be reset via a 1 Bit object. Alternatively, a service count down timer can be activated for each channel, which triggers a 1 bit alarm after previously defined operating hours and sends the remaining time as a 4 Byte object.

## Central switch function

The central switch function can be activated per channel. This function enables simple programming of central switch functions. If the communication object of the central function is triggered, all channels with activated central function are switched.

## Lock function/ priority/ forced guidance

In addition to the usual lock function, the switch actuator also offers priority/forced guidance per channel. Priority/forced guidance can be used to switch a channel permanently ON or OFF. The behaviour in the event of bus voltage failure, bus voltage recovery, locking and unlocking or priority can be set differently. A fallback time can be set for the priority function, after which the channel returns to the normal state.

## Status objects

The actuators have a status object for each channel with adjustable sending conditions and cyclical sending. In addition, an inverted status object can be activated. This can be used for visualisations or logics.

## Long Frame Support

The AZI switch actuator supports "long frames" (longer telegrams). These contain more user data per telegram, which significantly reduces the programming time.

### 2.3 Connection diagram

The following figure shows the connection diagram using the 3-channel unit as an example:

Figure 1: Connection diagram - AZI-0316.03

### 2.4 Structure \& Handling

The following pictures show the structure of the switch actuators:

Figure 2: Structure \& Handling
1 = Bus connecting terminal
2 = Programming button
3 = Red programming LED
$4=$ Connection terminals
5 = Green channel indicator LED
$6=$ Buttons for manual operation

## Important note:

The green channel indicator LED on the actuator reflects the status of the status object (" 1 " = LED On, " 0 " = LED Off). It does not reflect the state of the relay contact, whether open or closed (important when configured as a "normally closed").

### 2.5 Commissioning

1. Wire the device according to the connection diagram.
2. Connect interface to the bus, e.g. MDT USB Interface.
3. Switch on bus voltage.
4. Press the programming button on the device for $>1 \mathrm{~s}$ (red programming LED lights up continuously).
5. Set and programme the individual address in the ETS.
(Programming LED turns off)
6. Configure and programme the settings in the application programme.

## 3 Communication objects

### 3.1 Standard settings of the communication objects

The following tables show the default settings for the communication objects:

| Standard Settings - Channels |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| No. | Name | Object Function | Length | C | R | W | T | U |
| 0 | Channel A: | Switch | 1 Bit | - |  | - |  |  |
| 1 | Channel A: | Staircase light | 1 Bit | - |  | - |  |  |
| 1 | Channel A: | Service required | 1 Bit | - | - |  | - |  |
| 1 | Channel A: | Switch pulse | 1 Bit | - |  | - |  |  |
| 2 | Channel A: | Time until next service | 2 Byte | - | - |  | - |  |
| 2 | Channel A: | Time until next service | 4 Byte | - | - |  | - |  |
| 2 | Channel A: | Meter reading: Operating hours | 2 Byte | - | - |  | - |  |
| 2 | Channel A: | Meter reading: Operating hours | 4 Byte | - | - |  | - |  |
| 2 | Channel A: | Staircase light with time | 1 Byte | - |  | - |  |  |
| 3 | Channel A: | Prewarning | 1 Bit | - |  |  | - |  |
| 3 | Channel A: | Reset: Operating hours | 1 Bit | - |  | - |  |  |

| 131/236 * | Actual electricity price | Electricity rate in Cent - Output | 4 Byte | - | - |  | - |  |

Table 2: Communication objects - Standard settings: General objects

* Objects for central functions are always at the end of the object list and thus depend on the number of channels. The first number applies to a device with 3 channels, the second number applies to a device with 6 channels.

The table above shows the preset default settings. The priority of the individual communications objects and the flags can be adjusted by the user as required. The flags assign the communication objects their respective tasks in programming, where C stands for communication, R for read, W for write, T for transmit and U for update.

## 4 ETS Parameter

### 4.1 General Settings

The following table shows the available settings:

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Startup time | $\begin{gathered} 2 \ldots 240 \mathrm{~s} \\ {[2 \mathrm{~s}]} \end{gathered}$ | Sets the time between restart and functional start-up of the device. |
| Send „In operation" cyclically | not active $1 \mathrm{~min}-24 h$ | Activation of a cyclical "In operation" telegram. |
| Manual operation | - active <br> - locked <br> - lockable via object | Setting if operation via buttons on the device is possible. |
| Economy mode, switch off LEDs after | not active $30 \mathrm{~s}-1 \mathrm{~h}$ | Setting whether the LEDs should be switched off after the set time. |
| Set energy meters to " 0 " after transmitting the application | - not active <br> - only intermediate meter <br> - Intermediate and main meter | Setting whether meter readings are deleted when the application is transferred. |
| All energy meters in the channel are writable via object | - not active <br> - active | Setting whether counter readings can be overwritten per object. |
| Behaviour after bus voltage return |  |  |
| Object „Day/Night" | - no request <br> - request | Setting whether the object should be automatically requested after bus voltage return. |
| Object „Time" | - no request <br> - request | Setting whether the object should be automatically requested after bus voltage return. |

Table 3: General settings

## Startup time

This time defines when the unit "boots up" after a restart (reset, reprogramming, bus voltage recovery). This can be important if, for example, a bus reset is carried out. If there are many units on a line, all units would start at the same time and load the bus. With a variable time, the units can thus start differently.

## "In operation"

"In operation" is used to show on the bus that the unit is "alive". If activated, an ON telegram is sent cyclically.

TECHNOLOGIES

## Behaviour after bus power return

"Object „Day/Night" no request/request" is only displayed with the following setting:
In the menu "Cost calculation" - "Calculate costs via", the selection must be either "two fixed values (Day/ Night)" or "two variable values (Day/Night)".

The following actions are possible with the "Manual operation" setting:

- active Manual operation possible
- locked Manual operation not possible
- lockable via object Manual operation can be locked / unlocked via object

Via "Economy mode, switch off LEDs after", the status LEDs can be deactivated after a certain time.
By means of "All energy meters in the channel are writable via object", existing meter readings of the energy meters can be transmitted - for example when replacing a device.
Important: The meter readings of the cost meters cannot be overwritten!

## Note:

- All functions of the current and consumption measurements are available approx. 30 seconds after a functional restart of the actuator (after programming or switching on the bus voltage). This also applies to "All energy meters in the channel writable via object" and "Reset" of the meter readings..
- When activating the parameter "Set energy meters to "0" after transmitting the application", already recorded meter readings are permanently deleted and cannot be restored!

The following table shows the communication objects:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| $106 / 211$ * | Central function - <br> Lock manual operation | 1 Bit | Locking/unlocking the manual operation |
| $107 / 212$ * | Central function - In operation | 1 Bit | Send Cyclic "In operation" telegram |
| $108 / 213$ * | Central function - Day/Night | 1 Bit | Receiving the value, whether "Day" or <br> "Night" |
| $109 / 214$ * | Central function - Time | 3 Byte | Receiving the time |

Table 4: General settings

* First number applies to unit with 3 channels, second number applies to unit with 6 channels.

### 4.2 Total: Active power

The active power measurement allows the output of the real active power by simultaneous measurement of current and voltage. The output value is therefore no longer a "theoretical" power at nominal voltage, but the actual power.

Important: Only channels in which the parameter "Add channel to overall evaluation (current, active power, energy meter, voltage error)" has been activated are included.
The following table shows the selection options:

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Active power measurement | - not active <br> - active | Activation/deactivation of the menu. |
| Object selection | - 4 Byte floating value in W (DPT 14.056) <br> - 2 Byte floating value in kW (DPT 9.024) | Selection of the datapoint type for the output object of the total active power. |
| Send value on change of ... | not active $5 \%-75 \%$ | Setting from which percentage change the value is to be sent. |
| Minimum change | not active 50 W - 5000 W | Value by which the value to be sent must change at least. <br> Only if change in \% is active. |
| Send cyclically every ... | not active, $1 \mathrm{~min}-24 \mathrm{~h}$ <br> [1 h] | Setting at which intervals the value is to be sent. |
| Monitoring of load exceedance | - not active <br> - active, Output: Switch <br> - active, Output: Scene | Activation of the load exceedance and selection of the output object. <br> A description follows in chapter 4.2.1 |
| Monitoring of load undercut | - not active <br> - active, Output: Switch <br> - active, Output: Scene | Activation of the load undercut and selection of the output object. <br> A description follows in chapter 4.2.2 |

Table 5: Settings - Total : Active Power

With the activation of the "Active power measurement", further parameters appear.
The data point type for the output object is defined via the "Object selection".
Furthermore, it can be determined at which change a value is to be sent. In order not to send too frequently in case of smaller measured values, a value can subsequently be defined by which the measured value must change at least.
With the parameter "Send cyclically every ...", a fixed sending interval is defined independent of the measured value.

The parameters for "Monitoring of load exceedance" and"Monitoring of load undercut" are explained in the following chapters.

TECHNOLOGIES

It is possible to write a value for the total active power from external. This is done via the object "Active power-External (Input)". The object is permanently displayed.

Important: The value does not overwrite the current value, but the entered value is added to the current meter reading.
Application example: Several active power meters are installed in the house. The current value of device 1 can now be sent to the object "External (Input)" of device 2. Device 2 then outputs the sum of both devices.

The following table shows the associated communication objects:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| $110 / 215$ * | Total: Active power - <br> Total value | 2 Byte <br> 4 Byte | Output object for the measured value. <br> DPT depending on the parameter setting. |
| $133 / 238$ * | Total: Active power - <br> External - Input | 2 Byte <br> 4 | Receive an external value. <br> 4 Byte |

Table 6: Communication objects - Total : Active Power

* First number applies to unit with 3 channels, second number applies to unit with 6 channels.

### 4.2.1 Monitoring of load exceedance

After activating the parameter, the following selection options are available:

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Value for exceedance | $\begin{gathered} 0 . . .27600 \mathrm{~W} \\ {[100]} \end{gathered}$ | Setting of the threshold for exceeding. |
| Send value if exceeded | - not active <br> - value „1" <br> - value „0" | Setting the value to be sent when the switching threshold is exceeded. Only with „Output: Switch". |
| Send scene if exceeded | not active $1-64$ <br> [1] | Setting of the scene to be sent when the switching threshold is exceeded. Only with „Output: Scene". |
| Send output cyclically | not active $1 \min -24 h$ | Setting at which intervals the value or scene is to be sent. |
| Switch off all channels | - not active <br> - active | Setting whether all channels should switch off when the threshold is exceeded. |
| Value for withdrawal | $\begin{gathered} 0 \text {... } 27600 \text { W } \\ {[100]} \end{gathered}$ | Setting the threshold for the withdrawal of the exceedance. |
| Send value on withdrawal | - not active <br> - value „1" <br> - value „0" | Setting the value to be sent when falling below the withdrawal threshold. Only with „Output: Switch". |
| Send scene on withdrawal | not active $1-64$ <br> [2] | Setting the scene to be sent when falling below the withdrawal threshold. Only with „Output: Scene". |
| Type of delay | - Delay after activation <br> - Delay after withdrawal | Setting to which function the delay should apply. |
| Delay time | $\begin{gathered} \text { 00:00:00 ... 08:00:00 hh:mm:ss } \\ {[00: 00: 00]} \end{gathered}$ | Entering a time by which the selected type is to be sent delayed. |

Table 7: Settings - Monitoring of load exceedance
When the individual "Value for exceedance" is overshot, the output object sends - depending on the setting - either a corresponding 1 Bit value or the desired scene number.

When falling below the individual "Value for withdrawal", the output object sends - depending on the setting - either a corresponding 1 Bit value or the desired scene number.
Important: The value for withdrawal must be smaller than the value for exceedance!
The parameter "Switch off all channels" can be used to set whether these should switch off when the threshold is exceeded. After switching off, each individual channel must be reactivated via object.

TECHNOLOGIES

Via the setting "Type of delay" it is possible to activate a switching delay either for the exceedance (delay after activation) or for the withdrawal of the exceedance (delay after withdrawal). The corresponding time is set with the "Delay time" setting. With the setting "00:00:00", switching is always direct.

The following table shows the associated communication objects:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| $113 /$ | Total: Active power - <br> $218 ~ *$ <br> Load exceedance | 1 Bit <br> 1 Byte | Output object for monitoring the load <br> exceedance. <br> DPT depending on the parameter setting |

[^1]* First number applies to unit with 3 channels, second number applies to unit with 6 channels.

### 4.2.2 Monitoring of load undercut

After activating the parameter, the following selection options are available:

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Value for undercut | $\begin{gathered} 0 . . .27600 \mathrm{~W} \\ {[5]} \end{gathered}$ | Setting of the threshold for undercutting |
| Send value if undercut | - not active <br> - value „1" <br> - value „0" | Setting the value to be sent when the switching threshold is undercut. <br> Only with „Output: Switch". |
| Send scene if undercut | not active $1-64$ <br> [1] | Setting of the scene to be sent when the switching threshold is undercut. <br> Only with „Output: Scene". |
| Send output cyclically | not active $1 \mathrm{~min}-24 h$ | Setting at which intervals the value or scene is to be sent. |
| Switch off all channels | - not active <br> - active | Setting whether all channels should switch off when the threshold is undercut. |
| Value for withdrawal | $\begin{gathered} 0 . . .27600 \mathrm{~W} \\ {[5]} \end{gathered}$ | Setting the threshold for the withdrawal of the undercut |
| Send value on withdrawal | - not active <br> - value „1" <br> - value „0" | Setting of the value to be sent when the withdrawal threshold is exceeded. <br> Only with „Output: Switch". |
| Send scene on withdrawal | not active $1-64$ <br> [2] | Setting of the scene to be sent when the withdrawal threshold is exceeded. Only with „Output: Scene". |
| Type of delay | Delay after activation Delay after withdrawal | Setting to which function the delay should apply. |
| Delay time | $\begin{gathered} \text { 00:00:00 ... 08:00:00 hh:mm:ss } \\ {[00: 00: 00]} \end{gathered}$ | Entering a time by which the selected type is to be sent delayed. |

Table 9: Settings - Monitoring of load undercut
When the value falls below the individual "Value for undercut", the output object sends - depending on the setting - either the corresponding 1 Bit value or the desired scene number.

When the individual "Value for withdrawal" is exceeded, the output object sends - depending on the setting - either the corresponding 1 Bit value or the desired scene number.
Important: The value for withdrawal must be greater than the value for undercut!
The parameter "Switch off all channels" can be used to set whether they should switch off when falling below the threshold. After switching off, each individual channel must be reactivated via the object.

TECHNOLOGIES

Via the setting "Type of delay" it is possible to activate a switching delay either for the undercut (delay after activation) or for the withdrawal of the undercut (delay after withdrawal). The corresponding time is set with the "Delay time" setting. With the setting "00:00:00", switching is always direct.

The following table shows the associated communication objects:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| 114 / | Total: Active power - | 1 Bit <br> $219 ~ * ~$ | Load undercut |

Table 10: Communication objects - Load undercut

* First number applies to unit with 3 channels, second number applies to unit with 6 channels.

### 4.3 Total: Current

Important: Only channels in which the parameter "Add channel to overall evaluation (current, active power, energy meter, voltage error)" has been activated are included.

The following table shows the available settings:

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Total current measurement | - not active <br> - active | Activation/deactivation of the menu. |
| Object selection | - 2 Byte value in mA (DPT 7.012) <br> - 2 Byte floating value in mA (DPT 9.021) <br> - 4 Byte floating value in A (DPT 14.019) | Selection of the datapoint type for the output object of the total active power. |
| Send value on change of ... | not active $5 \%-75 \%$ | Setting from which percentage change the value is to be sent. |
| Minimum change | not active $50 \mathrm{~mA}-5 \mathrm{~A}$ | Value by which the value to be sent must change at least. Only if change in \% is active. |
| Send cyclically every ... | not active, $1 \mathrm{~min}-24 \mathrm{~h}$ <br> [1 h] | Setting at which intervals the value is to be sent. |
| Monitoring of current exceedance | - not active <br> - active, Output: Switch <br> - active, Output: Scene | Activation of the current exceedance and selection of the output object. <br> A description follows in chapter 4.3.1 |
| Monitoring of current undercut | - not active <br> - active, Output: Switch <br> - active, Output: Scene | Activation of the current undercut and selection of the output object. <br> A description follows in chapter 4.3.2 |

Table 11: Settings - Total : Current

With the activation of the "Total current measurement", further parameters appear.
The data point type for the output object is defined via the "Object selection".
Furthermore, it can be determined at which change a value is to be sent. In order not to send too frequently in case of smaller measured values, a value can subsequently be defined by which the measured value must change at least.

With the parameter "Send cyclically every ...", a fixed sending interval is defined independent of the measured value.

The parameters for monitoring of current exceedance and monitoring of current undercut are explained in the following chapters.

TECHNOLOGIES

The following table shows the associated communication objects:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| $111 /$ <br> $216 ~ *$ | Total current - Current value | 2 Byte <br> 4 Byte | Output object for the measured value. <br> DPT depending on the parameter setting. |

Table 12: Communication objects - Total : Current

* First number applies to unit with 3 channels, second number applies to unit with 6 channels.

### 4.3.1 Monitoring of current exceedance

After activating the parameter, the following selection options are available:

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Value range | $\begin{aligned} & \text { - } \quad 100 \mathrm{~mA}-1000 \mathrm{~mA} \\ & -\quad 1 \mathrm{~A}-48 / 70 \mathrm{~A} \end{aligned}$ | Preselection and limitation of the exceedance value range.. <br> Values in " $A$ " depend on the number of channels. |
| Value for exceedance | $\begin{gathered} 100 \ldots 1000 \mathrm{~mA}[1000] \\ 1 . . .48 / 70 \mathrm{~A}[\mathbf{2 0}] \end{gathered}$ | Setting of the threshold for exceeding.. Unit depends on the set value range. |
| Send value if exceeded | - not active <br> - value „1" <br> - value „"" | Setting the value to be sent when the switching threshold is exceeded. Only with „Output: Switch". |
| Send scene if exceeded | not active $1-64$ <br> [1] | Setting of the scene to be sent when the switching threshold is exceeded. <br> Only with „Output: Scene". |
| Send output cyclically | not active <br> 1 min - 24 h | Setting at which intervals the value or scene is to be sent. |
| Switch off all channels | - not active <br> - active | Setting whether all channels should switch off when the threshold is exceeded. |
| Value range for withdrawal | $\begin{aligned} & \text { - } \quad 100 \mathrm{~mA}-1000 \mathrm{~mA} \\ & -\quad 1 \mathrm{~A}-48 / 70 \mathrm{~A} \end{aligned}$ | Preselection and limitation of the value range for withdrawal of exceedance. Values in " $A$ " depend on the number of channels. |
| Value for withdrawal | $\begin{gathered} 100 \ldots 1000 \mathrm{~mA} \text { [100] } \\ 1 \ldots 48 / 70 \mathrm{~A}[10] \end{gathered}$ | Setting the threshold for the withdrawal of the exceedance. <br> Unit depends on the set value range. |
| Send value on withdrawal | - not active <br> - value „1" <br> - value „0" | Setting the value to be sent when falling below the withdrawal threshold. <br> Only with „Output: Switch". |
| Send scene on withdrawal | not active $1-64$ <br> [2] | Setting the scene to be sent when falling below the withdrawal threshold. Only with „Output: Scene". |
| Type of delay | - Delay after activation <br> - Delay after withdrawal | Setting to which function the delay should apply. |
| Delay time | $\begin{gathered} \text { 00:00:00 ... 08:00:00 hh:mm:ss } \\ {[00: 00: 00]} \end{gathered}$ | Entering a time by which the selected type is to be sent delayed. |

[^2]By means of the parameters "Value range" and "Value range for withdrawal", the respective setting range of the threshold is adapted to the current value to be expected.

When the individual "Value for exceedance" is overshot, the output object sends - depending on the setting - either a corresponding 1 Bit value or the desired scene number.

When falling below the individual "Value for withdrawal", the output object sends - depending on the setting - either a corresponding 1 Bit value or the desired scene number.
Important: The value for withdrawal must be smaller than the value for exceedance!
The parameter "Switch off all channels" can be used to set whether these should switch off when the threshold is exceeded. After switching off, each individual channel must be reactivated via object.

Via the setting "Type of delay" it is possible to activate a switching delay either for the exceedance (delay after activation) or for the withdrawal of the exceedance (delay after withdrawal). The corresponding time is set with the "Delay time" setting. With the setting "00:00:00", switching is always direct.

The following table shows the associated communication objects:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| $115 /$ <br> 220 | Total current - <br> Current exceedance | 1 Bit <br> 1 Byte | Output object for monitoring the current <br> exceedance. <br> DPT depending on the parameter setting |

[^3]* First number applies to unit with 3 channels, second number applies to unit with 6 channels.

### 4.3.2 Monitoring of current undercut

After activating the parameter, the following selection options are available:

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Value range | $\begin{aligned} & \text { - } 100 \mathrm{~mA}-1000 \mathrm{~mA} \\ & -\quad 1 \mathrm{~A}-48 / 70 \mathrm{~A} \end{aligned}$ | Preselection and limitation of the undercut value range. <br> Values in " $A$ " depend on the number of channels. |
| Value for undercut | $\begin{gathered} 100 \text {... } 1000 \mathrm{~mA} \text { [100] } \\ 1 \text {... } 48 \text { / } 70 \mathrm{~A}[10] \end{gathered}$ | Setting of the threshold for undercutting. Unit depends on the set value range. |
| Send value if undercut | - not active <br> - value „1" <br> - value „0" | Setting of the value to be sent when falling below the threshold.. <br> Only with „Output: Switch". |
| Send scene if undercut | not active $1-64$ <br> [1] | Setting of the scene to be sent when falling below the threshold. Only with „Output: Scene". |
| Send output cyclically | not active $1 \mathrm{~min}-24 h$ | Setting at which intervals the value or scene is to be sent. |
| Switch off all channels | - not active <br> - active | Setting whether all channels should switch off when the threshold is undercut. |
| Value range for withdrawal | $\begin{aligned} & \text { - } \quad 100 \mathrm{~mA}-1000 \mathrm{~mA} \\ & -\quad 1 \mathrm{~A}-48 / 70 \mathrm{~A} \end{aligned}$ | Preselection and limitation of the range of values for the withdrawal of the undercut. Values in "A" depend on the number of channels. |
| Value for withdrawal | $\begin{gathered} 100 \text {... } 1000 \mathrm{~mA}[1000] \\ 1 \text {... } 48 \text { / } 70 \mathrm{~A}[\mathbf{2 0}] \end{gathered}$ | Setting the threshold for the withdrawal of the undercut. <br> Unit depends on the set value range. |
| Send value on withdrawal | - not active <br> - value „1" <br> - value „0" | Setting of the value to be sent when the withdrawal threshold is exceeded. <br> Only with „Output: Switch". |
| Send scene on withdrawal | not active $1-64$ <br> [2] | Setting of the scene to be sent when the withdrawal threshold is exceeded. Only with „Output: Scene". |
| Type of delay | - Delay after activation <br> - Delay after withdrawal | Setting to which function the delay should apply. |
| Delay time | 00:00:00 ... 08:00:00 hh:mm:ss [00:00:00] | Entering a time by which the selected type is to be sent delayed. |

[^4]TECHNOLOGIES

By means of the parameters "Value range" and "Value range for withdrawal", the respective setting range of the threshold is adapted to the current value to be expected.

When the value falls below the individual "Value for undercut", the output object sends - depending on the setting - either the corresponding 1 Bit value or the desired scene number.

When the individual "Value for withdrawal" is exceeded, the output object sends - depending on the setting - either the corresponding 1 Bit value or the desired scene number.
Important: The value for withdrawal must be greater than the value for undercut!
The parameter "Switch off all channels" can be used to set whether they should switch off when falling below the threshold. After switching off, each individual channel must be reactivated via the object.

Via the setting "Type of delay" it is possible to activate a switching delay either for the undercut (delay after activation) or for the withdrawal of the undercut (delay after withdrawal). The corresponding time is set with the "Delay time" setting. With the setting "00:00:00", switching is always direct.

The following table shows the associated communication objects:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| $116 /$ <br> 221 | Total current - <br> Current undercut | 1 Bit <br> 1 Byte | Output object for monitoring of current <br> undercut. <br> DPT depending on the parameter setting |

Table 16: Communication objects - Current undercut

* First number applies to unit with 3 channels, second number applies to unit with 6 channels.

### 4.4 Total: Energy and cost meter

Important: Only channels in which the parameter "Add channel to overall evaluation (current, active power, energy meter, voltage error)" has been activated are included.

The table shows the possible settings:

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :--- | :--- | :--- |

| Meter | - not active <br> - active | Activation/deactivation of the various counters |
| :---: | :---: | :---: |
| Main meter (is automatically active after activating "Meter") |  |  |
| Object selection (from HW R4.2) | - Value in Wh (DPT 13.010) <br> - Value in kWh (DPT 13.013) | Selection of the datapoint type for the main meter. |
| Send meter reading on change | - not active <br> - active | Setting whether the meter reading should be sent when changed. |
| Send meter reading every ... | $\begin{aligned} & 10-50000 \mathrm{~Wh} \\ & \quad[10 \mathrm{~Wh}] \\ & 1 \ldots 65535 \mathrm{kWh} \\ & {[10 \mathrm{kWh}]} \end{aligned}$ | Setting for which change the meter reading is to be sent. <br> Selection depends on the selected datapoint type. |
| Send meter reading cyclically every ... | not active, $1 \mathrm{~min}-24 \mathrm{~h}$ [1 h] | Setting whether and at what interval the meter reading is to be sent cyclically. |
| Intermediate meter |  |  |
| Intermediate meter | - not active <br> - active | Activation of the intermediate meter. |
| Object selection | - Value in Wh (DPT 13.010) <br> - Value in kWh (DPT 13.013) | Selection of the datapoint type for the intermediate meter. |
| Send meter reading on change | - not active <br> - active | Setting whether the meter reading should be sent when changed. |
| Send meter reading every ... | $\begin{aligned} & 10-50000 \mathrm{~Wh} \\ & \quad[10 \mathrm{~Wh}] \\ & 1 \ldots 65535 \mathrm{kWh} \\ & {[10 \mathrm{kWh}]} \end{aligned}$ | Setting for which change the meter reading is to be sent.. <br> Selection depends on the selected datapoint type. |
| Send meter reading cyclically every ... | not active, $1 \mathrm{~min}-24 \mathrm{~h}$ <br> [1 h] | Setting whether and at what interval the meter reading is to be sent cyclically. |

| Cost meter (Settings are the same for main and intermediate meter) |  |  |  |
| :--- | :--- | :--- | :--- |
| Cost meter | ■ not active | Activation of the cost meter. |  |
| Send meter reading on <br> change | ■ not active | active | Setting whether the meter reading <br> should be sent when changed. |

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Send meter reading every ... | $\begin{gathered} 1 \ldots 255 € \\ {[100 €]} \\ {[10 €]} \end{gathered}$ | Setting for which change the meter reading is to be sent. |
| Send meter reading cyclically every ... | not active, $1 \mathrm{~min}-24 \mathrm{~h}$ <br> [1 h] | Setting whether and at what interval the meter reading is to be sent cyclically. |
| Event A / Event B |  |  |
| Activate Event A/B with | - not active <br> - final value: intermediate meter <br> - final value: main meter <br> - final value: costs intermediate meter <br> - final value: costs main meter <br> - time <br> - interval | Determination of the action with which an event is to be activated. |
| Final value | $1 . . .4294967295 €$ <br> [200] | Value from which the event is to be activated. <br> Only with "final value: costs ...". |
| Final value | 1 ... 4294967295 kWh/Wh [200] | Value from which the event is to be activated. <br> Visible when "final value ..." is selected. <br> DPT for main meter is " $k W h$ ". <br> DPT for intermediate meter depends on the "Object selection" parameter |
| Hours | $\begin{gathered} 0 \ldots 23 \\ {[0]} \end{gathered}$ | Specify the time or interval at which the event is to be activated. |
| Minutes | $\begin{gathered} 0 \ldots 59 \\ {[0]} \end{gathered}$ | selected |
| Day | - every day <br> - Monday <br> - Tuesday <br> - Wednesday <br> - Thursday <br> - Friday <br> - Saturday <br> - Sunday <br> - every working day <br> - every weekend day | Setting on which day(s) the event is to be activated. <br> Visible when "Time" is selected. |

| ETS Text |  | Dynamic range <br> [Default value] | Comment |
| :--- | :--- | :--- | :--- |

Table 17: Settings - Total: Energy and cost meter

## Main meter / Intermediate meter

The parameter "Object selection" can be used to set the datapoint type of the main and intermediate meters independently (Wh or kWh).
Important: The selection at the main meter requires the units HW R4.2!
The setting "Send meter reading on change" can be used to set at which change the meter sends its actual meter reading. If the setting is "not active", the meter does not send a value, no matter how big the change is.

The setting "Send meter reading cyclically every ..." can be used to set the intervals at which the device sends its actual measured value. The cyclical sending function can be activated or deactivated independently of the setting "Send meter reading on change". Values are also sent if the meter has not recorded a change. If both parameters are deactivated, no value is ever sent.

## Cost meter

Here, sending conditions for the meter reading can be set for both the main and intermediate meters. The settings correspond to the settings for the main and intermediate meters.

## Event A / Event B

Two different events can be triggered if certain conditions are met. This is done via 1 Bit objects. In addition to sending the object (Event A or Event B), other actions can be performed. These can be activated individually as required:

## final value: intermediate/main meter

Event is activated with a fixed value

## final value: costs intermediate/main meter

Event is activated when a certain cost level is reached.

## time

Event is executed recurrently at a certain time. In addition to hours and minutes, it is also possible to set whether the event is to be activated on certain days.

## Interval

Event is activated recurrently at a defined interval (in hours and minutes).
Important: The starting point and subsequent cyclical transmission repetition is always after reprogramming or when the bus voltage returns!

The following table shows the associated communication objects:

| Number | Name / Object function | Length | Usage |
| :---: | :---: | :---: | :---: |
| 117 / 222 * | Total: Intermediate meter Active energy (Wh/kWh) | 4 Byte | Sending the meter reading. DPT depending on setting |
| 118 / 223 * | Total: Intermediate meter Costs in Cent /Euro - Output | 2 Byte <br> 4 Byte | Sending the actual costs. DPT according to setting in "Cost calculation |
| 119 / 224 * | Total: Intermediate meter - Meter reading "Day" | 4 Byte | Sending the meter reading |
| 120 / 225 * | Total: Intermediate meter - Meter reading "Night" | 4 Byte | Sending the meter reading |
| 121/226* | Total: Intermediate meter - Reset | 1 Bit | Resetting the intermediate meter |
| 122 / 227* | Total: Main meter - Active energy (kWh) | 4 Byte | Sending the meter reading |
| 123 / 228* | Total: Main meter - <br> Costs in Cent /Euro - Output | 2 Byte <br> 4 Byte | Sending the actual costs. DPT according to setting in "Cost calculation" |
| 124 / 229* | Total: Main meter - Meter reading "Day" | 4 Byte | Sending the meter reading |
| 125 / 230 * | Total: Main meter - Meter reading "Night" | 4 Byte | Sending the meter reading |
| 126/231* | Total: Main meter - Reset | 1 Bit | Resetting the main meter |
| 127 / 232 * | Total: Meter - Event A | 1 Bit | Sending the value of Event A |
| 128/233 * | Total: Meter - Event B | 1 Bit | Sending the value of Event B |

Table 18: Communication objects - Total: Energy and cost meter

* First number applies to unit with 3 channels, second number applies to unit with 6 channels.

TECHNOLOGIES

### 4.5 Cost calculation

The following table shows the available settings:

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Calculate costs via | - a fixed value (Day) <br> - two fixed values (Day /Night) <br> - a variable value (Day) <br> - two variable values (Day/Night) | Setting of how the costs for consumption are to be calculated. |
| Electricity rate „Day" | $\begin{gathered} 0,000 \ldots 10,000 € / \mathrm{KWh} \\ {[0,22]} \end{gathered}$ | Setting the tariff for „Day". Only for "fixed" values. |
| Electricity rate „Night" | $\begin{gathered} 0,000 \ldots 10,000 € / \mathrm{KWh} \\ {[0,18]} \end{gathered}$ | Setting the tariff for „Night". Only for "two fixed" values. |
| DPT for object „Actual electricity price" | - 4 Byte Floating [Cent] <br> - 2 Byte Floating [Cent] <br> - 4 Byte Floating [Euro] <br> - 2 Byte Floating [Euro] | Specifying the datapoint type. Only for "fixed" values |
| DPT for object „Electricity price Day" and „Actual electricity price " | - 4 Byte Floating [Cent] <br> - 2 Byte Floating [Cent] <br> - 4 Byte Floating [Euro] <br> - 2 Byte Floating [Euro] | Specifying the datapoint type. Only for „one variable value". |
| DPT for object „Electricity price Day/Night" and „, Actual electricity price " | - 4 Byte Floating [Cent] <br> - 2 Byte Floating [Cent] <br> - 4 Byte Floating [Euro] <br> - 2 Byte Floating [Euro] | Specifying the datapoint type. Only for „two variable values". |
| "Day" <-> "Night" change is controlled via | - "Day/Night" object (Day = 1, Night = 0) <br> - "Day/Night" object (Day = 0, Night = 1) time | Setting for how the changeover between "Day" and "Night" is to be carried out. |
| Time to switch from „Day" to „Night" | $\begin{gathered} 0 \ldots 23 \mathrm{~h} \\ {[0]} \end{gathered}$ | Setting of the respective switching time in hours and minutes, when to switch between "Day" and "Night".. Only with selection „time" |
| Time to switch from „Day" to „Night" | $0 \text {... } 59 \text { min }$ <br> [0] |  |
| Time to switch from "Night" to „Day" | $\begin{gathered} 0 \ldots 23 \mathrm{~h} \\ {[0]} \end{gathered}$ |  |
| Time to switch from „Night" to „Day" | $\begin{gathered} 0 \ldots 59 \min \\ {[0]} \end{gathered}$ |  |

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| DPT for costs at intermediate and main meter | - 4 Byte floating [Cent] <br> - 2 Byte floating [Cent] <br> - 4 Byte floating [Euro] <br> - 2 Byte floating [Euro] | Determination of the datapoint type. |
| Separate "Day/Night" meters | - not active <br> - active | Setting whether meters for "Day" or "Night" mode are to be separated. |

Table 19: Settings - Cost calculation

When calculating costs via fixed values, the corresponding tariff for "Day" or "Day" and "Night" is set in the ETS. When calculating via variable values, the tariffs are entered via objects. The currently valid tariff is output via the object - "Current electricity price". The datapoint type for input and output can each be defined via parameters.

When the parameter "Separate "Day/Night" meters" is activated, objects for "Meter reading Day and Night" are displayed for the respective channels as well as for the "Total: Intermediate and Main meters". Accordingly, "Day" and "Night" are then counted separately.

The following table shows the corresponding communication objects:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| $108 / 213^{*}$ | Central function - Day/Night | 1 Bit | Receiving the value, whether "Day" or <br> "Night |
| $109 / 214$ * | Central function - Time | 3 Byte | Receiving the time |
| $129 / 234$ * | Electricity price: "Tag" - Electricity <br> rate in Cent/Euro - Input |  | Receive the current electricity price. <br> DPT according to parameter setting |
| $130 / 235$ * | Electricity price: "Night" - <br> Electricity rate in Cent/Euro - Input |  | Receive the current electricity price. <br> DPT according to parameter setting |
| $131 / 236$ * | Actual electricity price - Electricity <br> rate in Cent/Euro - Output |  | Sending the current electricity price. <br> DPT according to parameter setting |

Table 20: Communication objects - Cost calculation

* First number applies to unit with 3 channels, second number applies to unit with 6 channels.

TECHNOLOGIES

### 4.6 Channel selection

The table shows the possible settings for each channel:

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :--- | :--- | :--- |
| Channel A - „X" | ■not active | Operating mode of the respective <br> channel. |
|  | ■Switch | Staircase light |
|  | ■Switch pulse |  |
|  | ■switch synchronously with channel A <br> switch synchronously with channel D <br> channel D" only for device with 6 <br> channels |  |

Table 21: Settings - Channel selection

With the activation of a channel, a submenu appears in which the channel can be configured according to the selection.
The selection options (Switch, Staircase light, Switch pulse) are described in the following chapters.
With the selection "switch synchronously with channel A", the respective channel switches simultaneously with channel A. No parameters for the switch function are shown here, as these are set in channel $A$. This setting is available from channel $B$.

Important: The setting is always possible for a maximum of 3 channels. It is thus possible to switch channels B and C synchronously with channel A.
Correspondingly, channels E and F can be switched synchronously with channel D.
With this function, for example, a three-phase motor or a cooker/oven can be directly connected and controlled without an external contactor.

TECHNOLOGIES

### 4.7 Identical settings: Description of channel/objects + Additional text

For each channel, two text fields are available for free labelling:

| Description of channel/objects | Bathroom |
| :--- | :--- |
| Additional text | Light mirror |

Figure 3: Settings - Text fields per channel
Texts with up to 30 characters can be stored for the "Description of channel/objects" field, texts with up to 80 characters can be stored for the "Additional text" field.

The text entered for "Description of channels/objects" appears both in the menu for the channel and in the communication objects of the channels.

| Channel selection | Number * | Name | Object Function |
| :---: | :---: | :---: | :---: |
| + Channel A: Bathroom | [-10 | Channel A: Bathroom | Switch |
|  | [4] | Channel A: Bathroom | Lock |

## Figure 4: Labelling: Channel and objects

The "Additional text" is merely additional information for the programmer. This text is not visible anywhere else.

TECHNOLOGIES

### 4.8 Switch

If a channel is selected for the "Switch" function, the corresponding menu appears. The individual settings are described in the following chapters.

Information on "Description of channel/objects" and "Additional text", see 4.7 Identical settings: Description of channel/objects + Additional text

Activation of:

- Logic
- Scenes
- Threshold switch
- Operating hours meter
- Active power measurement
- Current measurement
- Voltage measurement
- Energy and cost meter
creates a new sub-menu in each case. These are also described separately below.

TECHNOLOGIES

### 4.8.1 Relay operating mode

The table shows the possible settings:

| ETS Text | Dynamic Range <br> [Default value] | Comment |
| :--- | :--- | :--- |
| Mode | normally open <br> ■ normally closed | Relay operating mode of the respective <br> channel. |

## Table 22: Settings - Relay operating mode

The "Mode" determines whether a relay is operated as a "normally open" or "normally closed" contact. This means whether the relay is activated with a " 1 " or with a " 0 ".

Important note: The green channel indicator LED on the actuator reflects the status of the status object (" 1 " = LED On, "0" = LED Off). It does not reflect the state of the relay contact, whether open or closed (important when configured as a "normally closed").

The following diagram shows the behaviour of a relay - in the operating mode as a "normally open" contact or as a "normally closed" contact - in response to a KNX telegram:

Figure 5: Diagram - Relay operation mode

### 4.8.2 Switch-on / -off delay

The table shows the possible settings:

| ETS Text | Dynamic Range <br> [Default value] | Comment |
| :--- | :---: | :--- |
| Switch-on/-off delay | $0 \ldots 30000 \mathrm{~s}$ <br> $[0 \mathrm{~s}]$ | Setting the time by which the switch-on/ <br> switch-off is to be delayed. |

Table 23: Setting - Switch-on/-off delay
The "Switch-on delay" causes a delayed switch-on of the switch output. This means that the output only switches at a certain time after the switch-on command has been given.

The "Switch-off delay" works according to the same principle as the switch-on delay. It causes a timedelayed switch-off. On-delay and off-delay can be combined.

The following diagram shows the combination of a switch-on and switch-off delay:

Figure 6: Diagram - Switch-on/-off delay

TECHNOLOGIES

## Important

- The delays are only effective with a switching command via the communication object (via the object "Switch" of the channel as well as via the central function "Switch").
- Manual operation via buttons on the device always reacts immediately (without delay).
- If a new command is sent during the expiry time for a delay, the last switching command applies.

## Example:

Switch-on delay $=5 \mathrm{~s}$
ON command is sent
An OFF command is sent after e.g. 3 seconds => OFF command is valid, ON command is no longer valid. Switch channel remains OFF.

### 4.8.3 Central function

The table shows the possible settings:

| ETS Text | Dynamic Range <br> [Default value] | Comment |
| :--- | :--- | :--- |
| Central function | - not active | Setting whether the channel should react <br> to the central switch function or not. |

Table 24: Setting - Central function
The central switch function can be selected for each individual channel. To do this, the "Central function" parameter must be set to "active". This function enables easier programming of central switch functions. If the communication object of the central function is now addressed, all channels with activated "Central function" are switched.

The following table shows the communication objects:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| $105 / 210$ * | Central function - Switch | 1 Bit | Central switching of the channels |

Table 25: Communication objects - Central function

* First number applies to unit with 3 channels, second number applies to unit with 6 channels.

### 4.8.4 Status functions

The table shows the possible settings:

| ETS Text | Dynamic Range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Send status | - not active, passive status object <br> - on change <br> - on change and lock <br> - on input of telegram | Sending condition of the status object. |
| Send status cyclically ( $0=$ not active) | $\begin{gathered} 0 \ldots 30000 \mathrm{~s} \\ {[0 \mathrm{~s}]} \end{gathered}$ | Setting of a time in which the status object is to be sent cyclically. |
| Additional inverted status | - not active <br> - active | Activation of an object for inverted status. |

Table 26: Settings - Status functions
With the parameter "Send status" the sending condition can be defined:

## - not active, passive status object

The status object is not actively sent but can be requested

- on change

The status object is sent each time the output is changed.

- on change and lock

The status object is sent whenever the output is changed - also during locking. Sending the status during locking ensures that a switch button sends the correct value after locking.

## - on input of telegram

The status object is sent out with every telegram input - regardless of the output change.
The setting "Send status cyclically" can be used to set whether and at what interval the current status is to be sent to the bus. With the setting " 0 s ", the function is inactive.

With the parameter "Additional inverted status", a new object can also be activated with which the current status is sent inverted. This is used, for example, for integration in logic functions or other subsequent functions.

The following table shows the communication objects:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| 7 | Channel A - Status | 1 Bit | Sends the status of the channel |
| 8 | Channel A - Inverted status | 1 Bit | Sends the inverted status of the channel |

Table 27: Communication objects - Status functions

TECHNOLOGIES

### 4.8.5 Add channel to overall evaluation ( ... )

The table shows the possible settings:

| ETS Text | Dynamic Range <br> [Default value] | Comment |
| :--- | :--- | :--- |
| Add channel to overall <br> evaluation (current, active <br> power, energy meter and <br> voltage error | - not active | Setting whether the channel is to be <br> included in the overall evaluation. |

Table 28: Setting - Add channel to overall evaluation

With this setting, it can be determined for each channel individually whether the channel is to be included in the calculation of the total current, the total active power, for the energy meter as well as in the evaluation of a voltage error for the actuator.

TECHNOLOGIES

### 4.8.6 Behaviour on locking / unlocking

The table shows the possible settings:

| ETS Text | Dynamic Range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Behaviour on locking | - OFF <br> - ON <br> - no change | Setting for how the channel should behave when a lock is set. |
| Behaviour on unlocking | - OFF <br> - ON <br> - no change <br> - previous state, catch up on switching <br> - previous state | Setting for how the channel should behave when it is unlocked. |

Table 29: Setting - Behaviour on locking / unlocking
If a channel is locked by sending a " 1 " to the lock object, the channel is locked for further operation until it is unlocked again by sending a "0" to the lock object.

The following actions can be executed when locking and unlocking:

- OFF

The channel is switched off.

- ON

The channel is switched on.

- no change

The channel retains the current state.

In addition, the following actions can be executed when unlocking:

- previous state, catch up on switching

The channel restores the status it had before the lock and catches up on possible switching commands received during the lock. The last command is assumed.

- previous state

The channel is restored to the state it was in before it was locked.

The following table shows the communication object:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| 4 | Channel A - Lock | 1 Bit | Activates / deactivates a lock |

Table 30: Communication object - Lock object

TECHNOLOGIES

### 4.8.7 Priority / Forced guidance

The table shows the possible settings:

| ETS Text | Dynamic Range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Priority / Forced guidance | - not active <br> - 2 Bit forced guidance <br> - 1 Bit priority ON <br> - 1 Bit priority OFF | Activate a priority or a forced guidance. |
| Fallback time for priority / forced guidance $(0=\text { not active })$ | $\begin{aligned} & 0 \ldots 600 \mathrm{~min} \\ & {[0 \mathrm{~min}]} \end{aligned}$ | Definition of a fallback time from priority / forced guidance back to the normal state. |
| Behaviour after deactivation of priority / Behaviour after forced guidance | - OFF <br> - ON <br> - no change <br> - previous state, catch up on switching <br> - previous state | Setting of the behaviour after deactivation of the priority / forced guidance. |

Table 31: Settings - Priority / Forced guidance
Priority/forced guidance causes prioritised switching of the output. Priority is switched via a 1 Bit object, forced guidance via a 2 Bit object. With the activation of a priority/forced guidance, the actuator channel is "forced" into a fixed position (ON or OFF), which has the highest priority. This means that the channel cannot be operated manually or via an object. This is only possible when the priority/forced guidance is withdrawn or when a set fallback time has expired.

The channel is switched on with the setting "1 Bit Priority ON" when activated with a " 1 " and switched off accordingly with the setting " 1 Bit Priority OFF". With a " 0 ", the priority is deactivated and the channel is in normal operation.

The object "Forced guidance" knows 3 possible states:

- control $=1$, value $=1$
- control $=1$, value $=0$
- control $=0$, value $=0$

Forced guidance ON
Forced guidance OFF
Forced guidance inactive

Channel is switched on
Channel is switched off
Channel is in normal operation

TECHNOLOGIES

With the fallback time, the priority / forced guidance can be automatically deactivated after a certain time and the channel changes back to "normal" operation after the fallback time has elapsed.

The following actions can be performed after deactivating priority / forced guidance:

- OFF

The channel is switched off.

- ON

The channel is switched on

- no change

The channel retains in current state.

- previous state, catch up on switching

The channel is restored to the state it was in before the "forced state", retaining the last switching command that was sent during the "forced state".

- previous state

The channel is restored to the state it was before it was "forced".

The following table shows the communication objects:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| 5 | Channel A - Priority | 1 Bit | Activate / deactivate the priority |
| 5 | Channel A - Forced guidance | 2 Bit | Activate / deactivate the forced guidance |

[^5]TECHNOLOGIES

### 4.8.8 Behaviour on bus power return / bus power failure

The table shows the possible settings:

| ETS Text | Dynamic Range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Behaviour on bus power return | - OFF <br> - ON <br> - no change | Behaviour on the return of the bus power. |
| Behaviour on bus power failure | - OFF <br> - ON <br> - no change | Behaviour in response to a bus power failure. |

Table 33: Settings - Behaviour on bus power return / bus power failure
The behaviour on bus power return / failure can be used to set which state the channel assumes on the respective event.

TECHNOLOGIES

### 4.8.9 Logic

The submenu "Logic" is displayed with activation of the parameter in the corresponding channel. The table shows the possible settings:

| ETS Text | Dynamic Range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Logic function | - with Switch object and one Logic object <br> - with Switch object and two Logic objects | Setting how many logic objects are used as inputs in addition to the switch object. |
| Logic operation | - OR <br> - AND <br> - XOR <br> - gate open with Logic object $=0$ <br> - gate open with Logic object = 1 | Setting according to which logical operation the logic should work. |
| Invert inputs | - not active <br> - object "Switch" <br> - object "Logic 1" <br> - object "Logic 2" <br> - object "Switch" and object "Logic 1" <br> - object "Switch" and object "Logic 2" <br> - object "Logic 1" and object "Logic 2" <br> - object "Switch", object "Logic 1" and object "Logic 2" | Setting whether and which inputs work inverted. <br> All settings with "Logic object 2" only available with "Logic function: with Switch object and two Logic objects". |
| Invert output | - not active <br> - active | Setting whether the output object should be inverted. |
| Set objects to value after bus power return | - not active <br> - active | Setting whether objects should be set to fixed values after bus power return. |
| Value for object "Switch" | - not active <br> - value $=0$ <br> - value = 1 | Only shown if "Set objects to value after bus voltage return" is active. |
| Value for object "Logic 1" | - not active <br> - value $=0$ <br> - value $=1$ | Setting with which value the objects are to be assigned after bus power |
| Value for object "Logic 2" | - not active <br> - value $=0$ <br> - value $=1$ |  |

[^6]The switch object is always an input of a logic function. It can also be determined whether one or two external logic objects are added for the function in order to carry out the logic operation. The result of the function is internally linked to the switch output (relay ON or OFF), therefore no output object is available. A logic with only external input objects is not possible here.
The logic functions switch the output ON when the following conditions are fulfilled:

- AND

When all inputs are active " 1 ".

- OR

If at least one input is active " 1 ".

- XOR

If only one input is active " 1 ".

- gate open with Logic object $=$ " 0 "

The output can only be switched via the object "switch" if the logic objects have the value " 0 ".

- gate open with Logic object = " 1 "

The output can only be switched via the object "switch" if the logic objects have the value " 1 ".
The polarity of the inputs and the output can be individually reversed via the parameters "Invert inputs / output".

The parameter "Set objects to value after bus voltage return" enables the logic to be set to a fixed value after bus power return.

The following table shows the communication objects:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| 9 | Channel A - Logic 1 | 1 Bit | Logic object 1, used for integration into a logic <br> function |
| 10 | Channel A - Logic 2 | 1 Bit | Logic object 2, used for integration into a logic <br> function |

[^7]
### 4.8.10 Scenes

The submenu "Scenes" is displayed with activation of the parameter in the corresponding channel. With a scene, it is possible to carry out several actions in different trades (e.g. light, heating, roller shutter) simultaneously with a button press or an operating command. All this happens with one telegram. With the help of the scene function of the switch actuator, the channels can be integrated into a scene control. To do this, a scene number ( $1 . . .64$ ) and a behaviour must be assigned to the corresponding memory location (scene A...H).

The table shows the possible settings:

| ETS Text | Dynamic Range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Learn scene | - not active <br> - active <br> - keep learned scene (do not maintain parameter settings) | Learning scenes. Activate / deactivate memory function. |
| Scene A-H | - not active <br> - active | Activation of the corresponding scene. |
| Scene number | not active $1-64$ | Setting of the scene number to which the channel should react. |
| Scene behaviour | - OFF <br> - ON <br> - lock <br> - unlock | Reaction of the selected channel to the call of this scene. |

Table 36: Settings - Scenes
If the parameter "Learn scene" is activated, a scene value can be changed and saved after calling up the scene. To do this, the triggering button must also be set to "save => active". If the button is now pressed for a longer time, the corresponding value is sent to the bus for saving (see table on the next page). The new value is then saved and will be executed the next time the scene is called up.

The parameter "keep learned scenes" has the effect that learned scenes are retained even after reprogramming.

The following table shows the communication objects:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| 6 | Channel A - Scene | 1 Byte | Call of the respective scene |

[^8]Note: A KNX scene is transmitted by a 1 Byte group address. When called up, scene 1 corresponds to the transmitted decimal value " 0 " or the hex value " 00 ". While the decimal value " 128 " or the hex value " 80 " is transmitted to save scene 1. The following table clarifies the relationship between scene number and transmitted value and helps with diagnosis via the group monitor of the ETS.

| Scene <br> No. | Call up |  | Save |  |
| :--- | :---: | :---: | :---: | :---: |
|  | Decimal | Hexadecimal | Decimal | Hexadecimal |
| 1 | 0 | $0 \times 00$ | 128 | $0 \times 80$ |
| 2 | 1 | $0 \times 01$ | 129 | $0 \times 81$ |
| 3 | 2 | $0 \times 02$ | 130 | $0 \times 82$ |
| $\ldots . . .$. | $\ldots$ | $\ldots$ | $\ldots$ |  |
| 64 | 63 | $0 \times 3 f$ | 191 | $0 \times B F$ |

[^9]
### 4.8.11 Threshold switch

The submenu "Threshold switch" is displayed with activation of the parameter in the corresponding channel. The following table shows the selection options:

| ETS Text | Dynamic Range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Datapoint type | 1 Byte DPT 5.001 Percent (0... 100 \%) 1 Byte DPT 5.005 Decimal factor (0...255) <br> ■ 2 Byte DPT 7.001 Pulse (0...65535) <br> - 2 Byte DPT 9.001 Temperature $\left({ }^{\circ} \mathrm{C}\right)$ <br> 2 Byte DPT 9.004 Brightness (Lux) | Setting of the datapoint type with which the threshold switch is to work. |
| Behaviour when undercut | - not active <br> - OFF <br> - ON | Setting which state the channel is to assume when the value falls below the threshold. |
| Lower threshold | Free value input | Setting of the value below which the channel is to switch. <br> Value and value range depending on the set datapoint type. |
| Behaviour when exceeded | - not active <br> - OFF <br> - ON | Setting which state the channel is to assume when the value is exceeded. |
| Upper threshold | Free value input | Setting of the value above which the channel is to switch. <br> Value and value range depending on the set datapoint type. |

Table 39: Settings - Threshold switch
The threshold switch enables the switching of the channel depending on an analogue value. For example, a channel can be switched on when a certain temperature is fallen below (lower threshold) in order to activate a radiator. If the temperature exceeds a certain value (upper threshold), the channel can be switched off again.

Important: The channel switches when the upper threshold value is exceeded and when the lower threshold value is undercut. Values in between act like a hysteresis, i.e. no change at the output.

TECHNOLOGIES

## Example:

## Parameter

| Upper threshold | $=20^{\circ} \mathrm{C}$ |
| :--- | :--- |
| Behaviour when exceeded | $=\mathrm{OFF}$ |
| Lower threshold | $=15^{\circ} \mathrm{C}$ |
| Behaviour when undercut | $=\mathrm{ON}$ |

Current status: Channel is switched on

## Reaction

Actual value $17^{\circ} \mathrm{C}=$ No reaction (remains ON)
Actual value $20^{\circ} \mathrm{C}=$ Channel switches OFF
Actual value $17^{\circ} \mathrm{C}=$ No reaction (remains OFF)
Actual value $14^{\circ} \mathrm{C}=$ Channel switches ON

The following table shows the communication object:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| 11 | Channel A - Threshold switch | 1 Byte <br> 2 Byte | Receive the input value. <br> DPT depending on the parameter setting |

[^10]
### 4.8.12 Operating hours meter

The submenu "Operating hours meter" is displayed with activation of the parameter in the corresponding channel. The following table shows the selection options:

| ETS Text | Dynamic Range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Type of meter | - operating hours meter <br> - service count down timer | Setting how the meter is to be used |
| Datapoint type | - 4 Byte value in s (DPT 13.100) <br> - 2 Byte value in $h$ (DPT 7.007) | Selection of the datapoint type for the output object. |
| Type "operating hours meter" |  |  |
| Send operating hours every ... ( $0=$ not active) | $\begin{gathered} 0 . . .10000 \mathrm{~h} \\ {[0 \mathrm{~h}]} \end{gathered}$ | Setting at which intervals the operating hours are to be sent. |
| Send operating hours cyclically every ... | not active $10 \min -4 h$ | Setting at which intervals the operating hours are to be sent cyclically. |
| Type "service count down timer" |  |  |
| Send "Time until next service" every ... <br> ( $0=$ not active) | $\begin{gathered} 0 . . .10000 \mathrm{~h} \\ {[0 \mathrm{~h}]} \end{gathered}$ | Setting at which intervals the "Time until next service" should be sent. |
| Send service message at intervals of ... | $\begin{gathered} 0 . . .60000 \mathrm{~h} \\ {[0 \mathrm{~h}]} \end{gathered}$ | Setting of the value from which to count down. |

Table 41: Settings - Operating hours meter

There are 2 operating modes for the meter to choose from:

## Operating hours meter

The operating hours meter counts the operating hours when the relay of the channel is closed.

## Send operating hours every ...

Set a sending interval in full hours at which the operating hours are to be sent. The value is only sent when a certain meter reading has been reached.

## Send operating hours cyclically every ...

Setting a cyclical transmission interval of the operating hours. The transmission cycle is fixed, regardless of whether the counter reading has changed in the meantime.

TECHNOLOGIES

The following communication objects are available for this operating mode:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| 2 | Channel A - <br> Meter reading - Operating hours | 2 Byte <br> 4 Byte | Sending the operating hours. <br> DPT depending on parameter setting |
| 3 | Channel A - <br> Reset operating hours | 1 Bit | Resetting the operating hours meter |

Table 42: Communication objects - Operating hours meter

## Service count down timer

The "Service count down timer" counts down from the set start value when the relay of the channel is closed. When the set time expires, a service message is sent via the corresponding object.

## Send "Time until next service" every ...

Set a sending interval in full hours at which the remaining hours until service are sent.

## Send service message at intervals of ...

Set the value from which to count down. When the counter value " 0 h " is reached, a service message is output via an object. This value is also valid if the service message was reset via object.

The following communication objects are available for this operating mode:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| 1 | Channel A - Service required | 1 Bit | Reporting an upcoming service |
| 2 | Channel A - <br> Time until next service | 2 Byte <br> 4 Byte | Sending the remaining service hours. <br> DPT depending on parameter setting |
| 3 | Channel A - <br> Reset: Service message | 1 Bit | Resetting the service hours to the parameter <br> value (Send service message at intervals of ...) |

[^11]
### 4.8.13 Active power measurement

The menu is displayed as soon as the "Active power measurement" parameter has been activated in the channel.

The following table shows the settings:

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Object selection | - 4 Byte floating value in W (DPT 14.056) <br> - 2 Byte floating value in kW (DPT 9.024) | Selection of the datapoint type for the output object of the total active power. |
| Send value on change of ... | not active, $5 \%-75 \%$ [10 \%] | Setting from which percentage change the value is to be sent. |
| Minimum change | $\begin{gathered} \text { not active } \\ 10 \mathrm{~W}-1000 \mathrm{~W} \end{gathered}$ | Value by which the value to be sent must change at least. <br> Only if change in \% is active. |
| Send cyclically every ... | not active $1 \mathrm{~min}-24 h$ | Setting at which intervals the value is to be sent. |
| Monitoring of load exceedance | - not active <br> active, Output: Switch <br> active, Output: Scene | Activation of the load exceedance and selection of the output object. A detailed description follows in chapter 4.8.13.1 |
| Monitoring of load undercut | - not active <br> - active, Output: Switch <br> - active, Output: Scene | Activation of the load undercut and selection of the output object. A detailed description follows in chapter 4.8.13.2 |
| Extended power measurement | - not active <br> - active | Activation/deactivation of the function. <br> A detailed description follows in chapter 4.8.13.3 |

Table 44: Settings - Active Power measurement

The data point type for the output object is defined via the "Object selection".
Furthermore, it can be determined at which change a value is to be sent. In order not to send too frequently in case of smaller measured values, a value can subsequently be defined by which the measured value must change at least.
With the parameter "Send cyclically every ...", a fixed sending interval is defined independent of the measured value.

The parameters for "Monitoring of load exceedance", "Monitoring of load undercut" and "Extended power measurement" are explained in the following chapters.

TECHNOLOGIES

The following table shows the associated communication objects:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| 12 | Channel A - Active power | 2 Byte <br> 4 Byte | Output object for the measured value. <br> DPT depending on the parameter setting. |

[^12]
### 4.8.13.1 Monitoring of load exceedance

After activating the parameter, the following selection options are available:

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Value for exceedance | $\begin{gathered} 0 \text {... } 4600 \mathrm{~W} \\ {[100]} \end{gathered}$ | Setting of the threshold for exceeding. |
| Send value if exceeded | - not active <br> - value „1" <br> - value „0" | Setting the value to be sent when the switching threshold is exceeded. Only with „Output: Switch". |
| Send scene if exceeded | not active $1-64$ <br> [1] | Setting of the scene to be sent when the switching threshold is exceeded. Only with „Output: Scene". |
| Send output cyclically | not active $1 \mathrm{~min}-24 \mathrm{~h}$ | Setting at which intervals the value or scene is to be sent. |
| Switch off channel | - not active <br> - active | Setting whether the channel should switch off when the threshold is exceeded. |
| Value for withdrawal | $\begin{gathered} 0 \text {... } 4600 \mathrm{~W} \\ {[100]} \end{gathered}$ | Setting the threshold for the withdrawal of the exceedance. |
| Send value on withdrawal | - not active <br> - value „1" <br> - value „0" | Setting the value to be sent when falling below the withdrawal threshold. <br> Only with „Output: Switch". |
| Send scene on withdrawal | not active $1-64$ <br> [2] | Setting the scene to be sent when falling below the withdrawal threshold. <br> Only with „Output: Scene". |
| Type of delay | - Delay after activation <br> - Delay after withdrawal | Setting to which function the delay should apply. |
| Delay time | $\begin{gathered} \text { 00:00:00 ... 08:00:00 hh:mm:ss } \\ {[00: 00: 00]} \end{gathered}$ | Entering a time by which the selected type is to be sent delayed. |

Table 46: Settings - Monitoring of load exceedance
When the individual "Value for exceedance" is overshot, the output object sends - depending on the setting - either a corresponding 1 Bit value or the desired scene number.

When falling below the individual "Value for withdrawal", the output object sends - depending on the setting - either a corresponding 1 Bit value or the desired scene number.
Important: The value for withdrawal must be smaller than the value for exceedance!
The parameter "Switch off channel" can be used to set whether this should switch off when the threshold is exceeded. After switching off, the channel must be reactivated via object.

TECHNOLOGIES

Via the setting "Type of delay" it is possible to activate a switching delay either for the exceedance (delay after activation) or for the withdrawal of the exceedance (delay after withdrawal). The corresponding time is set with the "Delay time" setting. With the setting "00:00:00", switching is always direct.

The following table shows the associated communication objects:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| 16 | Channel A - <br> Load exceedance | 1 Bit <br> 1 Byte | Output object for monitoring the load <br> exceedance. <br> DPT depending on the parameter setting |

[^13]
### 4.8.13.2 Monitoring of load undercut

After activating the parameter, the following selection options are available:

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Value for undercut | $\begin{gathered} 0 \ldots 4600 \mathrm{~W} \\ {[5]} \end{gathered}$ | Setting of the threshold for undercutting |
| Send value if undercut | - not active <br> - value „1" <br> - value „0" | Setting the value to be sent when the switching threshold is undercut. Only with „Output: Switch". |
| Send scene if undercut | not active $1-64$ <br> [1] | Setting of the scene to be sent when the switching threshold is undercut. Only with „Output: Scene". |
| Send output cyclically | not active $1 \mathrm{~min}-24 h$ | Setting at which intervals the value or scene is to be sent. |
| Switch off channel | - not active <br> - active | Setting whether the channel should switch off when the threshold is undercut. |
| Value for withdrawal | $\begin{gathered} 0 \ldots 4600 \mathrm{~W} \\ {[100]} \end{gathered}$ | Setting the threshold for the withdrawal of the undercut |
| Send value on withdrawal | - not active <br> - value „1" <br> - value „0" | Setting of the value to be sent when the withdrawal threshold is exceeded. <br> Only with „Output: Switch". |
| Send scene on withdrawal | not active $1-64$ <br> [2] | Setting of the scene to be sent when the withdrawal threshold is exceeded. <br> Only with „Output: Scene". |
| Type of delay | - Delay after activation <br> - Delay after withdrawal | Setting to which function the delay should apply. |
| Delay time | $\begin{gathered} \text { 00:00:00 ... 08:00:00 hh:mm:ss } \\ {[00: 00: 00]} \end{gathered}$ | Entering a time by which the selected type is to be sent delayed. |

Table 48: Settings - Monitoring of load undercut
When the value falls below the individual "Value for undercut", the output object sends - depending on the setting - either the corresponding 1 Bit value or the desired scene number.

When the individual "Value for withdrawal" is exceeded, the output object sends - depending on the setting - either the corresponding 1 Bit value or the desired scene number.
Important: The value for withdrawal must be greater than the value for undercut!

TECHNOLOGIES

The parameter "Switch off channel" can be used to set whether this should switch off when falling below the threshold. After switching off, the channel must be reactivated via the object.

Via the setting "Type of delay" it is possible to activate a switching delay either for the undercut (delay after activation) or for the withdrawal of the undercut (delay after withdrawal). The corresponding time is set with the "Delay time" setting. With the setting "00:00:00", switching is always direct.

The following table shows the associated communication objects:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| 17 | Channel A - Load undercut | 1 Bit <br> 1 Byte | Output object for monitoring of load undercut. <br> DPT depending on the parameter setting |

Table 49: Communication objects - Load undercut

### 4.8.13.3 Extended power measurement

After activating the parameter in the channel, the following setting options are available:

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Object selection | - Apparent power in VA (DPT 14.056) <br> - Apparent power in kVA (DPT 9.024) <br> - Reactive power in $\operatorname{Var}$ (DPT 14.056) <br> - Reactive power in kVar (DPT 9.024) <br> - Power factor in cos Phi <br> (DPT 14.057) | Setting of the object type that is to be output additionally. |
| Send value on change of ... | not active, $5 \%-75 \%$ [10 \%] | Setting from which percentage change the value is to be sent. |
| Send cyclically every ... | not active $1 \mathrm{~min}-24 h$ | Setting at which intervals the value is to be sent. |

Table 50: Settings - Extended power measurement
With "Object selection", in addition to the active power, another "power" or the "power factor cos Phi" can be output via an object. It can be selected for the apparent power and the reactive power whether it is a 2 Byte or a 4 Byte object.

The parameters "Send value on change of ..." and "Send cyclically every ..." can also be used to define send conditions.

The following table shows the associated communication object:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| 15 | Channel A - <br> Extended power measurement: <br> Apparent power / Reactive power <br> / Power factor cos Phi | 2 Byte <br> 4 Byte | Output object for the measured value. <br> DPT depending on the parameter setting. |

[^14]TECHNOLOGIES

### 4.8.14 Current measurement

The menu is displayed as soon as the "Current measurement" parameter has been activated in the channel.

The following table shows the settings:

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Object selection | 2 Byte value in mA (DPT 7.012) <br> - 2 Byte floating value in mA (DPT 9.021) <br> - 4 Byte floating value in $A$ (DPT 14.019) | Selection of the datapoint type for the output object of the current measurement. |
| Send value on change of ... | not active, $5 \%-75 \%$ [10 \%] | Setting from which percentage change the value is to be sent. |
| Minimum change | not active $10 \mathrm{~mA}-1 \mathrm{~A}$ | Value by which the value to be sent must change at least. <br> Only if change in \% is active. |
| Send cyclically every ... | not active $1 \mathrm{~min}-24 \mathrm{~h}$ | Setting at which intervals the value is to be sent. |
| Monitoring of current exceedance | - not active <br> - active, Output: Switch <br> - active, Output: Scene | Activation of the current exceedance and selection of the output object. A detailed description follows in chapter 4.8.14.1 |
| Monitoring of current undercut | - not active <br> - active, Output: Switch <br> - active, Output: Scene | Activation of the current undercut and selection of the output object. A detailed description follows in chapter 4.8.14.2 |
| Error message | - not active <br> - Load failure with closed contact <br> - Residual current with open contact <br> - Residual current / Load failure | Selection in which error case a 1 Bit telegram is to be sent. |
| Threshold | $\begin{gathered} 20 \mathrm{~mA}-2 \mathrm{~A} \\ {[20 \mathrm{~mA}]} \end{gathered}$ | Setting of the threshold value for sending an error message. Only displayed if "Error message" is active. |

Table 52: Settings - Current measurement

TECHNOLOGIES

The datapoint type for the output object is defined via the "Object selection".
It can also be determined at which change a value is to be sent. In order not to send too often for smaller measured values, a value can be defined subsequently by which the measured value must change at least. The parameter "Send cyclically every ..." is used to set a fixed send interval independent of the measured value.
The parameters for "Monitoring of current exceedance" and "Monitoring of current undercut" are explained in the following chapters.

## Error message

## Load failure with closed contact:

If the set threshold is fallen below when the contact is closed, the "Load failure" output object sends a " 1 ". Exceedance again resets the value to " 0 ".

## Residual current with open contact:

If the actuator measures a current greater than the set threshold when the contact is open, the "Residual current" output object sends a " 1 ".

## Residual current / Load failure:

The output object "Residual current / Load failure" sends a "1" in both error cases.

The following table shows the associated communication objects:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| 13 | Channel A - Current value | 2 Byte <br> 4 Byte | Output of the currently measured value. <br> DPT depending on the parameter setting. |
| 34 | Channel A - Load failure | 1 Bit | Output object for the error message in the <br> event of a load failure. |
| 34 | Channel A - Residual current | 1 Bit | Output object for the error message in the <br> event of a residual current. |
| 34 | Channel A - <br> Residual current / Load failure | 1 Bit | Output object for the error message in case <br> of residual current and load failure. |

Table 53: Communication objects - Current measurement

### 4.8.14.1 Monitoring of current exceedance

After activating the parameter, the following settings are available:

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Value range | $\begin{aligned} & \text { - } \quad 10 \mathrm{~mA}-1000 \mathrm{~mA} \\ & -\quad 1 \mathrm{~A}-20 \mathrm{~A} \end{aligned}$ | Preselection and limitation of the value range of the exceedance. |
| Value for exceedance | $\begin{gathered} 10 \ldots 1000 \mathrm{~mA}[10] \\ 1 \ldots 20 \mathrm{~A}[1] \end{gathered}$ | Setting of the threshold for exceeding. Unit depends on the set value range. |
| Send value if exceeded | - not active <br> - value „1" <br> - value „0" | Setting the value to be sent when the switching threshold is exceeded. Only with „Output: Switch". |
| Send scene if exceeded | not active $1-64$ <br> [1] | Setting of the scene to be sent when the switching threshold is exceeded. Only with „Output: Scene". |
| Send output cyclically | not active $1 \mathrm{~min}-24 h$ | Setting at which intervals the value or scene is to be sent. |
| Switch off channel | - not active <br> - active | Setting whether the channel should switch off when the threshold is exceeded. |
| Value range for withdrawal | $\begin{aligned} & \text { - } 10 \mathrm{~mA}-1000 \mathrm{~mA} \\ & -\quad 1 \mathrm{~A}-20 \mathrm{~A} \end{aligned}$ | Preselection and limitation of the value range for withdrawal of exceedance. |
| Value for withdrawal | $\begin{gathered} 10 \ldots 1000 \mathrm{~mA}[10] \\ 1 \ldots 20 \mathrm{~A}[1] \end{gathered}$ | Setting the threshold for the withdrawal of the exceedance. <br> Unit depends on the set value range. |
| Send value on withdrawal | - not active <br> - value „1" <br> - value „0" | Setting the value to be sent when falling below the withdrawal threshold. <br> Only with „Output: Switch". |
| Send scene on withdrawal | not active $1-64$ <br> [2] | Setting the scene to be sent when falling below the withdrawal threshold. <br> Only with „Output: Scene". |
| Type of delay | Delay after activation Delay after withdrawal | Setting to which function the delay should apply. |
| Delay time | $\begin{gathered} \text { 00:00:00 ... 08:00:00 hh:mm:ss } \\ {[00: 00: 00]} \end{gathered}$ | Entering a time by which the selected type is to be sent delayed. |

[^15]By means of the parameters "Value range" and "Value range for withdrawal", the respective setting range of the threshold is adapted to the current value to be expected.

When the individual "Value for exceedance" is overshot, the output object sends - depending on the setting - either a corresponding 1 Bit value or the desired scene number.

When falling below the individual "Value for withdrawal", the output object sends - depending on the setting - either a corresponding 1 Bit value or the desired scene number.
Important: The value for withdrawal must be smaller than the value for exceedance!
The parameter "Switch off channel" can be used to set whether this should switch off when the threshold is exceeded. After switching off, the channel must be reactivated via object.

Via the setting "Type of delay" it is possible to activate a switching delay either for the exceedance (delay after activation) or for the withdrawal of the exceedance (delay after withdrawal). The corresponding time is set with the "Delay time" setting. With the setting "00:00:00", switching is always direct.

The following table shows the associated communication objects:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| 18 | Channel A - <br> Current exceedance | 1 Bit <br> 1 Byte | Output object for monitoring the current <br> exceedance. <br> DPT depending on the parameter setting |

[^16]
### 4.8.14.2 Monitoring of current undercut

After activating the parameter, the following settings are available:

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Value range | $\begin{aligned} & -\quad 10 \mathrm{~mA}-1000 \mathrm{~mA} \\ & -\quad 1 \mathrm{~A}-20 \mathrm{~A} \end{aligned}$ | Preselection and limitation of the undercut value range. |
| Value for undercut | $\begin{gathered} 10 \ldots 1000 \mathrm{~mA}[10] \\ 1 \ldots 20 \mathrm{~A}[1] \end{gathered}$ | Setting of the threshold for undercutting. Unit depends on the set value range. |
| Send value if undercut | - not active <br> - value „1" <br> - value „0" | Setting of the value to be sent when falling below the threshold.. Only with „Output: Switch". |
| Send scene if undercut | not active $1-64$ <br> [1] | Setting of the scene to be sent when falling below the threshold. Only with „Output: Scene". |
| Send output cyclically | not active $1 \mathrm{~min}-24 h$ | Setting at which intervals the value or scene is to be sent. |
| Switch off channel | - not active <br> - active | Setting whether the channel should switch off when the threshold is undercut. |
| Value range for withdrawal | $\begin{aligned} & -\quad 10 \mathrm{~mA}-1000 \mathrm{~mA} \\ & -\quad 1 \mathrm{~A}-20 \mathrm{~A} \end{aligned}$ | Preselection and limitation of the range of values for the withdrawal of the undercut. |
| Value for withdrawal | $\begin{gathered} 10 \ldots 1000 \mathrm{~mA}[10] \\ 1 \ldots 20 \mathrm{~A}[1] \end{gathered}$ | Setting the threshold for the withdrawal of the undercut. <br> Unit depends on the set value range. |
| Send value on withdrawal | - not active <br> - value „1" <br> - value „0" | Setting of the value to be sent when the withdrawal threshold is exceeded. Only with „Output: Switch". |
| Send scene on withdrawal | not active $1-64$ <br> [2] | Setting of the scene to be sent when the withdrawal threshold is exceeded. <br> Only with „Output: Scene". |
| Type of delay | Delay after activation Delay after withdrawal | Setting to which function the delay should apply. |
| Delay time | $\begin{gathered} \text { 00:00:00 ... 08:00:00 hh:mm:ss } \\ {[00: 00: 00]} \end{gathered}$ | Entering a time by which the selected type is to be sent delayed. |

[^17]By means of the parameters "Value range" and "Value range for withdrawal", the respective setting range of the threshold is adapted to the current value to be expected.

When the value falls below the individual "Value for undercut", the output object sends - depending on the setting - either the corresponding 1 Bit value or the desired scene number.

When the individual "Value for withdrawal" is exceeded, the output object sends - depending on the setting - either the corresponding 1 Bit value or the desired scene number.

Important: The value for withdrawal must be greater than the value for undercut!
The parameter "Switch off channel" can be used to set whether this should switch off when falling below the threshold. After switching off, the channel must be reactivated via the object.

Via the setting "Type of delay" it is possible to activate a switching delay either for the undercut (delay after activation) or for the withdrawal of the undercut (delay after withdrawal). The corresponding time is set with the "Delay time" setting. With the setting "00:00:00", switching is always direct.

The following table shows the associated communication objects:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| 19 | Channel A - Current undercut | 1 Bit <br> 1 Byte | Output object for monitoring of current <br> undercut. <br> DPT depending on the parameter setting |

[^18]
### 4.8.15 Voltage measurement

The menu is displayed as soon as the "Voltage measurement" parameter has been activated in the channel.

The following table shows the settings:

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Send value on change of ... | not active, $5 \%-75 \%$ [10 \%] | Setting from which percentage change the value is to be sent. |
| Send cyclically every ... | not active $1 \mathrm{~min}-24 h$ | Setting at which intervals the value is to be sent. |
| Monitoring of voltage exceedance | - not active <br> - active, Output: Switch <br> - active, Output: Scene | Activation of the voltage exceedance and selection of the output object. A detailed description follows in chapter4.8.15.1 |
| Monitoring of voltage undercut | - not active <br> - active, Output: Switch <br> - active, Output: Scene | Activation of the voltage undercut and selection of the output object.. A detailed description follows in chapter 4.8.15.2 |

Table 58: Settings - Voltage measurement
With activation, the actual voltage value at the channel is measured.
The sending conditions for the measured value can be set. On the one hand, it can be defined at which change a value is to be sent, on the other hand, a fixed sending interval can be determined with the parameter "Send cyclically every ..." independent of the measured value.

The parameters for "Monitoring of voltage exceedance" and "Monitoring of voltage undercut" are explained in the following chapters.

The following table shows the associated communication objects:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| 14 | Channel A - Voltage value | 4 Byte | Output of the currently measured value. |

Table 59: Communication object - Voltage measurement

### 4.8.15.1 Monitoring of voltage exceedance

After activating the parameter, the following settings are available:

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Value for exceedance | $\begin{gathered} 180 \ldots 300 \mathrm{~V} \\ {[260 \mathrm{~V}]} \end{gathered}$ | Setting of the threshold for exceeding. |
| Send value if exceeded | - not active <br> - value „1" <br> - value „0" | Setting the value to be sent when the switching threshold is exceeded. <br> Only with „Output: Switch". |
| Send scene if exceeded | not active $1-64$ <br> [1] | Setting of the scene to be sent when the switching threshold is exceeded. Only with „Output: Scene". |
| Send output cyclically | not active $1 \mathrm{~min}-24 \mathrm{~h}$ | Setting at which intervals the value or scene is to be sent. |
| Switch off channel | - not active <br> - active | Setting whether the channel should switch off when the threshold is exceeded. |
| Value for withdrawal | $\begin{gathered} 180 \ldots 300 \mathrm{~V} \\ {[240 \mathrm{~V}]} \end{gathered}$ | Setting the threshold for the withdrawal of the exceedance. |
| Send value on withdrawal | - not active <br> - value „1" <br> - value „0" | Setting the value to be sent when falling below the withdrawal threshold. Only with „Output: Switch". |
| Send scene on withdrawal | not active 1-64 <br> [2] | Setting the scene to be sent when falling below the withdrawal threshold. <br> Only with „Output: Scene". |
| Type of delay | - Delay after activation <br> - Delay after withdrawal | Setting to which function the delay should apply. |
| Delay time | $\begin{gathered} \text { 00:00:00 ... 08:00:00 hh:mm:ss } \\ {[00: 00: 00]} \end{gathered}$ | Entering a time by which the selected type is to be sent delayed. |

Table 60: Settings - Monitoring of voltage exceedance
When the individual "Value for exceedance" is overshot, the output object sends - depending on the setting - either a corresponding 1 Bit value or the desired scene number.

When falling below the individual "Value for withdrawal", the output object sends - depending on the setting - either a corresponding 1 Bit value or the desired scene number.

Important: The value for withdrawal must be smaller than the value for exceedance!

TECHNOLOGIES

The parameter "Switch off channel" can be used to set whether this should switch off when the threshold is exceeded. After switching off, the channel must be reactivated via object.

Via the setting "Type of delay" it is possible to activate a switching delay either for the exceedance (delay after activation) or for the withdrawal of the exceedance (delay after withdrawal). The corresponding time is set with the "Delay time" setting. With the setting "00:00:00", switching is always direct.

The following table shows the associated communication objects:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| 20 | Channel A - <br> Voltage exceedance | 1 Bit <br> 1 Byte | Output object for monitoring the voltage <br> exceedance. <br> DPT depending on the parameter setting |

[^19]
### 4.8.15.2 Monitoring of voltage undercut

After activating the parameter, the following settings are available:

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Value for undercut | $\begin{gathered} 180 \ldots 300 \mathrm{~V} \\ {[210 \mathrm{~V}]} \end{gathered}$ | Setting of the threshold for undercutting |
| Send value if undercut | - not active <br> - value „1" <br> - value „0" | Setting of the value to be sent when falling below the threshold.. <br> Only with „Output: Switch". |
| Send scene if undercut | not active $1-64$ <br> [1] | Setting of the scene to be sent when falling below the threshold. Only with „Output: Scene". |
| Send output cyclically | not active $1 \mathrm{~min}-24 \mathrm{~h}$ | Setting at which intervals the value or scene is to be sent. |
| Switch off channel | - not active <br> - active | Setting whether the channel should switch off when the threshold is undercut. |
| Value for withdrawal | $\begin{gathered} 180 \ldots 300 \mathrm{~V} \\ {[230 \mathrm{~V}]} \end{gathered}$ | Setting the threshold for the withdrawal of the undercut. |
| Send value on withdrawal | - not active <br> - value „1" <br> - value „0" | Setting of the value to be sent when the withdrawal threshold is exceeded. <br> Only with „Output: Switch". |
| Send scene on withdrawal | not active 1-64 <br> [2] | Setting of the scene to be sent when the withdrawal threshold is exceeded. <br> Only with „Output: Scene". |
| Type of delay | - Delay after activation Delay after withdrawal | Setting to which function the delay should apply. |
| Delay time | $\begin{gathered} \text { 00:00:00 ... 08:00:00 hh:mm:ss } \\ {[00: 00: 00]} \end{gathered}$ | Entering a time by which the selected type is to be sent delayed. |

Table 62: Settings - Monitoring of voltage undercut
When the value falls below the individual "Value for undercut", the output object sends - depending on the setting - either the corresponding 1 Bit value or the desired scene number.

When the individual "Value for withdrawal" is exceeded, the output object sends - depending on the setting - either the corresponding 1 Bit value or the desired scene number.
Important: The value for withdrawal must be greater than the value for undercut!

The parameter "Switch off channel" can be used to set whether this should switch off when falling below the threshold. After switching off, the channel must be reactivated via the object.

Via the setting "Type of delay" it is possible to activate a switching delay either for the undercut (delay after activation) or for the withdrawal of the undercut (delay after withdrawal). The corresponding time is set with the "Delay time" setting. With the setting "00:00:00", switching is always direct.

The following table shows the associated communication objects:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| 21 | Channel A - Voltage undercut | 1 Bit <br> 1 Byte | Output object for monitoring of voltage <br> undercut. <br> DPT depending on the parameter setting |

[^20]
### 4.8.16 Energy and cost meter

The menu is displayed as soon as the parameter "Energy and cost meter" has been activated in the channel.

The following table shows the selection options:

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Main meter (is automatically active) |  |  |
| Object selection (from HW R4.2) | - Value in Wh (DPT 13.010) <br> - Value in kWh (DPT 13.013) | Selection of the datapoint type for the main meter. |
| Send meter reading on change | - not active <br> - active | Setting whether the meter reading should be sent when changed. |
| Send meter reading every ... | $\begin{gathered} 10-50000 \mathrm{~Wh} \\ {[10 \mathrm{~Wh}]} \\ 1 \ldots 65535 \mathrm{kWh} \\ {[1 \mathrm{kWh}]} \end{gathered}$ | Setting for which change the meter reading is to be sent. <br> Selection depends on the selected datapoint type. |
| Send meter reading cyclically every ... | $\begin{aligned} & \text { not active } \\ & 1 \mathrm{~min}-24 \mathrm{~h} \\ & {[5 \mathrm{~min}]} \end{aligned}$ | Setting whether and at what interval the meter reading is to be sent cyclically. |
| Intermediate meter |  |  |
| Intermediate meter | - not active <br> - active | Activation of the intermediate meter. |
| Object selection | - Value in Wh (DPT 13.010) <br> - Value in kWh (DPT 13.013) | Selection of the datapoint type for the intermediate meter. |
| Send meter reading on change | - not active <br> - active | Setting whether the meter reading should be sent when changed. |
| Send meter reading every ... | $\begin{aligned} & 10-50000 \mathrm{~Wh} \\ & \quad[10 \mathrm{~Wh}] \\ & 1 \ldots 65535 \mathrm{kWh} \\ & \quad[1 \mathrm{kWh}] \end{aligned}$ | Setting for which change the meter reading is to be sent. <br> Selection depends on the selected datapoint type. |
| Send meter reading cyclically every ... | not active $1 \mathrm{~min}-24 h$ | Setting whether and at what interval the meter reading is to be sent cyclically. |
| Cost meter (Settings are the same for main and intermediate meter) |  |  |
| Cost meter | - not active <br> - active | Activation of the cost meter. |
| Send meter reading on change | - not active <br> - active | Setting whether the meter reading should be sent when changed. |

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Send meter reading every ... | $\begin{gathered} 1 \ldots 255 € \\ {[100 €]} \\ {[10 €]} \end{gathered}$ | Setting for which change the meter reading is to be sent. |
| Send meter reading cyclically every ... | $\begin{aligned} & \text { not active } \\ & 1 \mathrm{~min}-24 \mathrm{~h} \\ & \text { [1 h] } \end{aligned}$ | Setting whether and at what interval the meter reading is to be sent cyclically. |
| Event A / Event B |  |  |
| Activate Event A/B with | - not active <br> - final value: intermediate meter <br> - final value: main meter <br> - final value: costs intermediate meter <br> - final value: costs main meter <br> - time <br> - interval | Determination of the action with which an event is to be activated. |
| Final value | $\begin{gathered} 1 \ldots 4294967295 € \\ {[200]} \end{gathered}$ | Value from which the event is to be activated. <br> Only with "final value: costs ...". |
| Final value | 1 ... 4294967295 kWh/Wh [200] | Value from which the event is to be activated. <br> Visible when "final value ..." is selected. <br> DPT for main meter is "kWh". <br> DPT for intermediate meter depends on the "Object selection" parameter |
| Hours | $\begin{gathered} 0 \ldots 23 \\ {[0]} \end{gathered}$ | Specify the time or interval at which the |
| Minutes | $\begin{gathered} 0 \ldots 59 \\ {[0]} \end{gathered}$ | If "Time" or "Interval" is selected |
| Day | - every day <br> - Monday <br> - Tuesday <br> - Wednesday <br> - Thursday <br> - Friday <br> - Saturday <br> - Sunday <br> - every working day <br> - every weekend day | Setting on which day(s) the event is to be activated. <br> Visible when "Time" is selected. |

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Object „Event A" / "Event B" sends | - OFF <br> - ON | Value to be sent when the condition for triggering the event is met. |
| Intermediate meter: Send all values | - not active <br> - active | Settings for which additional actions are to be carried out when the condition for activating the event is fulfilled. <br> The number of possible actions depends on the selection "Activate event $X$ with". |
| Intermediate meter: Send costs | - not active <br> - active |  |
| Intermediate meter: Reset | - not active <br> - active |  |
| Main meter: Send all values | - not active <br> - active |  |
| Main meter: Send costs | - not active <br> - active |  |
| Main meter: <br> Reset | - not active <br> - active |  |

Table 64: Settings - Energy and cost meter

## Main meter / Intermediate meter

The parameter "Object selection" can be used to set the datapoint type of the main and intermediate meters independently (Wh or kWh).
Important: The selection at the main meter requires the units HW R4.2!
The setting "Send meter reading on change" can be used to set at which change the meter sends its actual meter reading. If the setting is "not active", the meter does not send a value, no matter how big the change is.

The setting "Send meter reading cyclically every ..." can be used to set the intervals at which the device sends its actual measured value. The cyclical sending function can be activated or deactivated independently of the setting "Send meter reading on change". Values are also sent if the meter has not recorded a change. If both parameters are deactivated, no value is ever sent..

## Cost meter

Here, sending conditions for the meter reading can be set for both the main and intermediate meters. The settings correspond to the settings for the main and intermediate meters.

Important: If the parameter "Separate Day/Night meters" in the menu "Cost calculation" is active, the objects "Intermediate meter: Electric active energy ( 24 h )" and "Main meter: Electric active energy ( 24 h )" are not writable!

## Event A / Event B

Two different events can be triggered if certain conditions are met. This is done via 1 Bit objects. In addition to sending the object (Event A or Event B), other actions can be performed. These can be activated individually as required:

## final value: intermediate/main meter

Event is activated with a fixed value
final value: costs intermediate/main meter
Event is activated when a certain cost level is reached.

## time

Event is executed recurrently at a certain time. In addition to hours and minutes, it is also possible to set whether the event is to be activated on certain days.

## Interval

Event is activated recurrently at a defined interval (in hours and minutes).
Important: The starting point and subsequent cyclical transmission repetition is always after reprogramming or when the bus voltage returns!

The following table shows the associated communication objects:

| Number | Name / Object function | Length | Usage |
| :---: | :---: | :---: | :---: |
| 22 | Channel A - Intermediate meter: Electrical active energy (24 h) | 4 Byte | Sending the meter reading. DPT depending on setting |
| 23 | Channel A - Intermediate meter: Costs in Cent /Euro - Output | 2 Byte <br> 4 Byte | Sending the actual costs. DPT according to setting in "Cost calculation" |
| 24 | Channel A - Intermediate meter: Meter reading "Day" | 4 Byte | Sending the meter reading |
| 25 | Channel A - Intermediate meter: Meter reading "Night" | 4 Byte | Sending the meter reading |
| 26 | Channel A - Intermediate meter: Reset | 1 Bit | Resetting the intermediate meter |
| 27 | Channel A - Main meter: <br> Electrical active energy (24 h) | 4 Byte | Sending the meter reading |
| 28 | Channel A - Main meter: Costs in Cent /Euro - Output | 2 Byte <br> 4 Byte | Sending the actual costs. DPT according to setting in "Cost calculation" |
| 29 | Channel A - Main meter: Meter reading "Day" | 4 Byte | Sending the meter reading |
| 30 | Channel A - Main meter: Meter reading "Night" | 4 Byte | Sending the meter reading |
| 31 | Channel A - Main meter: Reset | 1 Bit | Resetting the main meter |
| 32 | Channel A - Meter: Event A | 1 Bit | Sending the value of Event A |
| 33 | Channel A - Meter: Event B | 1 Bit | Sending the value of Event B |

[^21]TECHNOLOGIES

### 4.9 Staircase light

Note: When selecting "Staircase light", the functions "Logic", "Threshold switch" and "Operating hours meter" are not available!

The staircase light function enables automatic switch-off after a preset time. The staircase light time is freely adjustable. The individual settings are described in the following chapters.

Information on "Description of channel/objects" and "Additional text", see 4.7 Identical settings: Description of channel/objects + Additional text

Activation of:

- Scenes
- Active power measurement
- Current measurement
- Voltage measurement
- Energy and cost meter
creates a new sub-menu in each case. These are also described separately below.

TECHNOLOGIES

### 4.9.1 Relay operating mode

The table shows the possible settings:

| ETS Text | Dynamic Range <br> [Default value] | Comment |
| :--- | :--- | :--- |
| Mode | normally open <br> ■ normally closed | Relay operating mode of the respective <br> channel. |

## Table 66: Settings - Relay operating mode

The "Mode" determines whether a relay is operated as a "normally open" or "normally closed" contact. This means whether the relay is activated with a " 1 " or with a " 0 ".

Important note: The green channel indicator LED on the actuator reflects the status of the status object ("1" = LED On, "0" = LED Off). It does not reflect the state of the relay contact, whether open or closed (important when configured as a "normally closed").

The following diagram shows the behaviour of a relay - in the operating mode as a "normally open" contact or as a "normally closed" contact - in response to a KNX telegram:

Figure 7: Diagram - Relay operation mode

### 4.9.2 Additional switch object

By activating the parameter "Additional switch object", an object is displayed which can switch the corresponding channel independently of the staircase light function. Via this switch object, the channel can be switched ON/OFF permanently and does not access the staircase light time.
As soon as the staircase light time is started again, the switching command via the additional object is no longer valid. Priority is therefore always given to the last command sent.

The following table shows the communication object:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| 0 | Channel A - Switch | 1 Bit | Switch object for permanent ON/OFF |

Table 67: Communication object - Additional switch object

### 4.9.3 Staircase light timer

The table shows the possible settings:

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :--- | :---: | :--- |
| Staircase light timer | $1 \ldots 30000 \mathrm{~s}$ <br> $[120 \mathrm{~s}]$ | Setting the duration of the staircase light <br> time. |

Table 68: Setting - Staircase light timer
When the staircase light time is activated, the channel switches. After the time has elapsed, it falls back to the previous state.

The following table shows the communication object:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| 1 | Channel A - Staircase light | 1 Bit | Object triggers the staircase light timer |

[^22]TECHNOLOGIES

### 4.9.4 Prewarning

The table shows the possible settings:

| ETS Text | Dynamic Range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Prewarning | - not active <br> - light On/Off <br> - prewarning object <br> - light On/Off and prewarning object | Setting of the prewarning function. |
| Prewarning duration | $\begin{gathered} 0 \ldots 30000 \mathrm{~s} \\ {[1]} \end{gathered}$ | Setting the prewarning duration. Only available for functions with "light On/Off". |
| Prewarning time | $\begin{gathered} 0 . . .30000 \mathrm{~s} \\ {[10]} \end{gathered}$ | Setting the prewarning time. |

Table 70: Settings - Prewarning
The prewarning function warns about the end of the staircase light timer.
The following options are available:

- light On/Off

After the staircase light timer has elapsed, the light is switched off for the set prewarning duration and then switched on again for the set prewarning time.

- prewarning object

An additional communication object is displayed for the prewarning. This object sends a " 1 " after the staircase light timer has elapsed - but the light remains switched on during this time. After the prewarning time has elapsed, the staircase light switches off and the prewarning object sends a " 0 ". With this setting, the total staircase light timer is extended by the set prewarning time.

- light On/Off and prewarning object

Combination of the above two settings.

The prewarning duration indicates the time that the channel is switched off after the staircase lighting timer has elapsed.

The prewarning time indicates the time the prewarning object sends a " 1 " or the light is switched on again after the prewarning duration.

Important: Total duration = staircase light timer + prewarning duration + prewarning time
The following diagram illustrates the time sequence:

Figure 8: Diagram - Prewarning
The following table shows the communication object:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| 3 | Channel A - Prewarning | 1 Bit | Sending the prewarning |

Table 71: Communication object - Prewarning

### 4.9.5 Manual switch-off

If this function is active, the channel can be switched off before the set staircase light timer has elapsed with a " 0 " to the "Staircase light" object.

TECHNOLOGIES

### 4.9.6 Extend staircase light time

The table shows the possible settings:

| ETS Text | Dynamic Range <br> [Default value] | Comment |
| :--- | :--- | :--- |
| Extend staircase <br> light time | not active <br> restart time <br> add time | Setting whether and how the staircase <br> light time can be extended. |

Table 72: Settings - Extend staircase light time
The following options are available:

## not active

Staircase light time cannot be extended and can only be restarted after the staircase light timer has expired.

## restart time

The staircase light timer is restarted by sending a " 1 " to the "Staircase light" object again.

## add time

The staircase light timer is added to the remaining staircase light time by sending a " 1 " to the object "Staircase light" again.

The following diagram shows the behaviour with the setting "Restart time":

Figure 9: Diagram - Extend staircase light time

TECHNOLOGIES

### 4.9.7 Staircase light with variable time

With this function, it is possible to individually set the staircase light timer via a separate communication object. The table shows the possible settings:

| ETS Text | Dynamic Range [Default value] | Comment |
| :---: | :---: | :---: |
| Factor for object "Staircase light with time" | - 1 s <br> - 10 s <br> - 1 min | Setting the time factor |

Table 73: Settings - Staircase light with variable time
The variable staircase light timer enables the staircase light to be started with variable time. For this purpose, a value of $0-255$ is sent to the 1 Byte input. The resulting staircase light timer is calculated as follows:

## Set time factor $\mathbf{x}$ sent value $=$ staircase light timer

The staircase light function with variable time can be used in large staircases, for example, to start the staircase light on each floor with an individual time.

The following table shows the communication object:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| 2 | Channel A - Staircase light with time | 1 Byte | Starting a variable staircase light timer |

[^23]
### 4.9.8 Central function

The table shows the possible settings:

| ETS Text | Dynamic Range <br> [Default value] | Comment |
| :--- | :--- | :--- |
| Central function | not active | Setting whether the channel should react <br> to the central switch function. |

Table 75: Setting - Central function
This function simplifies the programming of central switch functions. If the communication object of the central function is triggered, all channels with activated central function are switched.

The following table shows the communication objects:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| $105 / 210$ * | Central function - Switch | 1 Byte | Central switching of the channels |

Table 76: Communication objects - Central function

* First number applies to unit with 3 channels, second number applies to unit with 6 channels.

### 4.9.9 Status functions

The table shows the possible settings:

| ETS Text | Dynamic Range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Send status | - not active, passive status object <br> - on change <br> - on change and lock <br> - on input of telegram | Sending condition of the status object. |
| Send status cyclically ( $0=$ not active) | $\begin{gathered} 0 \ldots 30000 \mathrm{~s} \\ {[0 \mathrm{~s}]} \end{gathered}$ | Setting of a time in which the status object is to be sent cyclically. |
| Additional inverted status | - not active <br> - active | Activation of an object for inverted status. |

Table 77: Settings - Status functions
With the parameter "Send status" the sending condition can be defined:

## - not active, passive status object

The status object is not actively sent but can be requested

- on change

The status object is sent each time the output is changed.

- on change and lock

The status object is sent whenever the output is changed - also during locking. Sending the status during locking ensures that a switch button sends the correct value after locking.

## - on input of telegram

The status object is sent out with every telegram input - regardless of the output change.
The setting "Send status cyclically" can be used to set whether and at what interval the current status is to be sent to the bus. With the setting " 0 s ", the function is inactive.

With the parameter "Additional inverted status", a new object can also be activated with which the current status is sent inverted. This is used, for example, for integration in logic functions or other subsequent functions.

The following table shows the communication objects:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| 7 | Channel A - Status | 1 Bit | Sends the status of the channel |
| 8 | Channel A - Inverted status | 1 Bit | Sends the inverted status of the channel |

Table 78: Communication objects - Status functions

TECHNOLOGIES

### 4.9.10 Add channel to overall evaluation ( ... )

The table shows the possible settings:

| ETS Text | Dynamic Range <br> [Default value] | Comment |
| :--- | :--- | :--- |

| Add channel to overall |
| :--- | :--- | :--- |
| evaluation (current, active |
| power, energy meter and |
| voltage error ) |$\quad$| not active |
| :--- |$\quad$| Setting whether the channel is to be |
| :--- |
| included in the overall evaluation. |

Table 79: Setting - Add channel to overall evaluation

With this setting, it can be determined for each channel individually whether the channel is to be included in the calculation of the total current, the total active power, for the energy meter as well as in the evaluation of a voltage error for the actuator.

### 4.9.11 Behaviour on locking / unlocking

The table shows the possible settings:

| ETS Text | Dynamic range <br> [Default value] |  |  |
| :--- | :--- | :--- | :--- |
| Behaviour on locking | -OFF <br> - | Comment |  |

Table 80: Setting - Behaviour on locking / unlocking
If a channel is locked by sending a " 1 " to the lock object, the channel is locked for further operation until it is unlocked again by sending a " 0 " to the lock object.

The following actions can be executed when locking and unlocking:

- OFF

The channel is switched off.

- ON (only for locking)

The channel is switched on permanently.

- no change (only for locking)

The channel retains the current state.

- start staircase light timer (only for unlocking)

The staircase light time is started.

The following table shows the communication object:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| 4 | Channel A - Lock | 1 Bit | Activates / deactivates a lock |

[^24]TECHNOLOGIES

### 4.9.12 Priority / Forced guidance

The table shows the possible settings:

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Priority / Forced guidance | - not active <br> - 2 Bit forced guidance <br> - 1 Bit priority ON <br> - 1 Bit priority OFF | Activate a priority or a forced guidance. |
| Fallback time for priority / forced guidance ( $0=$ not active) | $\begin{aligned} & 0 \ldots 600 \mathrm{~min} \\ & {[0 \mathrm{~min}]} \end{aligned}$ | Definition of a fallback time from priority / forced guidance back to the normal state. |
| Behaviour after deactivation of priority / Behaviour after forced guidance | - OFF <br> - start staircase light timer | Setting of the behaviour after deactivation of the priority / forced guidance. |

Table 82: Settings - Priority / Forced guidance
Priority/forced guidance causes prioritised switching of the output. Priority is switched via a 1 Bit object, forced guidance via a 2 Bit object. With the activation of a priority/forced guidance, the actuator channel is "forced" into a fixed position (ON or OFF), which has the highest priority. This means that the channel cannot be operated manually or via an object. This is only possible when the priority/forced guidance is withdrawn or when a set fallback time has expired.

The channel is switched on with the setting "1 Bit Priority ON" when activated with a "1" and switched off accordingly with the setting " 1 Bit Priority OFF". With a " 0 ", the priority is deactivated and the channel is in normal operation.

The object "Forced guidance" knows 3 possible states:

- control $=1$, value $=1$
- control $=1$, value $=0$
- control $=0$, value $=0$

Forced guidance ON
Forced guidance OFF
Forced guidance inactive

Channel is switched on
Channel is switched off
Channel is in normal operation

TECHNOLOGIES

With the fallback time, the priority / forced guidance can be automatically deactivated after a certain time and the channel changes back to "normal" operation after the fallback time has elapsed.

The following actions can be performed after deactivating priority / forced guidance:

- OFF

The channel is switched off.

- start staircase light timer

The staircase light time is started..

The following table shows the communication objects:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| 5 | Channel A - Priority | 1 Bit | Activate / deactivate the priority |
| 5 | Channel A - Forced guidance | 2 Bit | Activate / deactivate the forced guidance |

[^25]TECHNOLOGIES

### 4.9.13 Behaviour on bus power return / bus power failure

The table shows the possible settings:

| ETS Text | Dynamic range <br> [Default value] |  |  |
| :--- | :--- | :--- | :--- |
| Behaviour on bus power <br> return | -OFF <br> start staircase light timer <br> state before bus power <br> failure | Comment |  |
| Behaviour on bus power <br> failure | ■OFF <br> ■ | ON <br> no change | Behaviour in response to a bus power <br> failure. |

Table 84: Settings - Behaviour on bus power return / bus power failure

The behaviour on bus power return / failure can be used to set which state the channel assumes on the respective event.

### 4.9.14 Scenes

The submenu "Scenes" is displayed with activation of the parameter in the corresponding channel. With a scene, it is possible to carry out several actions in different trades (e.g. light, heating, roller shutter) simultaneously with a button press or an operating command. All this happens with one telegram. With the help of the scene function of the switch actuator, the channels can be integrated into a scene control. To do this, a scene number ( $1 . . .64$ ) and a behaviour must be assigned to the corresponding memory location (scene A...H).

The table shows the possible settings:

| ETS Text | Dynamic Range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Learn scene | - not active <br> - active <br> - keep learned scene (do not maintain parameter settings) | Learning scenes. Activate / deactivate memory function. |
| Scene A-H | - not active <br> - active | Activation of the corresponding scene. |
| Scene number | not active $1-64$ | Setting of the scene number to which the channel should react. |
| Scene behaviour | - OFF <br> - ON <br> - lock <br> - unlock | Reaction of the selected channel to the call of this scene. |

Table 85: Settings - Scenes
If the parameter "Learn scene" is activated, a scene value can be changed and saved after calling up the scene. To do this, the triggering button must also be set to "save => active". If the button is now pressed for a longer time, the corresponding value is sent to the bus for saving (see table on the next page). The new value is then saved and will be executed the next time the scene is called up.

The parameter "keep learned scenes" has the effect that learned scenes are retained even after reprogramming.

The following table shows the communication objects:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| 6 | Channel A - Scene | 1 Byte | Call of the respective scene |

[^26]Note: A KNX scene is transmitted by a 1 Byte group address. When called up, scene 1 corresponds to the transmitted decimal value " 0 " or the hex value " 00 ". While the decimal value " 128 " or the hex value " 80 " is transmitted to save scene 1. The following table clarifies the relationship between scene number and transmitted value and helps with diagnosis via the group monitor of the ETS.

| Scene <br> No. | Call up |  | Save |  |
| :--- | :---: | :---: | :---: | :---: |
|  | Decimal | Hexadecimal | Decimal | Hexadecimal |
| 1 | 0 | $0 \times 00$ | 128 | $0 \times 80$ |
| 2 | 1 | $0 \times 01$ | 129 | $0 \times 81$ |
| 3 | 2 | $0 \times 02$ | 130 | $0 \times 82$ |
| $\ldots . . .$. | $\ldots$ | $\ldots$ | $\ldots$ |  |
| 64 | 63 | $0 \times 3 f$ | 191 | $0 \times B F$ |

[^27]
### 4.9.15 Active power measurement

The menu is displayed as soon as the "Active power measurement" parameter has been activated in the channel.

The following table shows the settings:

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Object selection | - 4 Byte floating value in W (DPT 14.056) <br> - 2 Byte floating value in kW (DPT 9.024) | Selection of the datapoint type for the output object of the total active power. |
| Send value on change of ... | not active, $5 \%-75 \%$ [10 \%] | Setting from which percentage change the value is to be sent. |
| Minimum change | $\begin{gathered} \text { not active } \\ 10 \mathrm{~W}-1000 \mathrm{~W} \end{gathered}$ | Value by which the value to be sent must change at least. <br> Only if change in \% is active. |
| Send cyclically every ... | not active $1 \mathrm{~min}-24 h$ | Setting at which intervals the value is to be sent. |
| Monitoring of load exceedance | - not active <br> active, Output: Switch <br> active, Output: Scene | Activation of the load exceedance and selection of the output object. A detailed description follows in chapter 4.9.15.1 |
| Monitoring of load undercut | - not active <br> - active, Output: Switch <br> - active, Output: Scene | Activation of the load undercut and selection of the output object. A detailed description follows in chapter 4.9.15.2 |
| Extended power measurement | - not active <br> - active | Activation/deactivation of the function. <br> A detailed description follows in chapter 4.9.15.3 |

Table 88: Settings - Active Power measurement

The data point type for the output object is defined via the "Object selection".
Furthermore, it can be determined at which change a value is to be sent. In order not to send too frequently in case of smaller measured values, a value can subsequently be defined by which the measured value must change at least.
With the parameter "Send cyclically every ...", a fixed sending interval is defined independent of the measured value.
The parameters for "Monitoring of load exceedance", "Monitoring of load undercut" and "Extended power measurement" are explained in the following chapters.

TECHNOLOGIES

The following table shows the associated communication object:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| 12 | Channel A - Active power | 2 Byte <br> 4 Byte | Output object for the measured value. <br> DPT depending on the parameter setting. |

[^28]
### 4.9.15.1 Monitoring of load exceedance

After activating the parameter, the following selection options are available:

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Value for exceedance | $\begin{gathered} 0 \text {... } 4600 \mathrm{~W} \\ {[100]} \end{gathered}$ | Setting of the threshold for exceeding. |
| Send value if exceeded | - not active <br> - value „1" <br> - value „0" | Setting the value to be sent when the switching threshold is exceeded. <br> Only with „Output: Switch". |
| Send scene if exceeded | not active $1-64$ <br> [1] | Setting of the scene to be sent when the switching threshold is exceeded. Only with „Output: Scene". |
| Send output cyclically | not active $1 \mathrm{~min}-24 h$ | Setting at which intervals the value or scene is to be sent. |
| Switch off channel | - not active <br> - active | Setting whether the channel should switch off when the threshold is exceeded. |
| Value for withdrawal | $\begin{gathered} 0 \ldots 4600 \mathrm{~W} \\ {[100]} \end{gathered}$ | Setting the threshold for the withdrawal of the exceedance. |
| Send value on withdrawal | - not active <br> - value „1" <br> - value „0" | Setting the value to be sent when falling below the withdrawal threshold. <br> Only with „Output: Switch". |
| Send scene on withdrawal | not active $1-64$ <br> [2] | Setting the scene to be sent when falling below the withdrawal threshold. <br> Only with „Output: Scene". |
| Type of delay | - Delay after activation <br> - Delay after withdrawal | Setting to which function the delay should apply. |
| Delay time | $\begin{gathered} \text { 00:00:00 ... 08:00:00 hh:mm:ss } \\ {[00: 00: 00]} \end{gathered}$ | Entering a time by which the selected type is to be sent delayed. |

Table 90: Settings - Monitoring of load exceedance
When the individual "Value for exceedance" is overshot, the output object sends - depending on the setting - either a corresponding 1 Bit value or the desired scene number.

When falling below the individual "Value for withdrawal", the output object sends - depending on the setting - either a corresponding 1 Bit value or the desired scene number.
Important: The value for withdrawal must be smaller than the value for exceedance!

TECHNOLOGIES

The parameter "Switch off channel" can be used to set whether this should switch off when the threshold is exceeded. After switching off, the channel must be reactivated via object.

Via the setting "Type of delay" it is possible to activate a switching delay either for the exceedance (delay after activation) or for the withdrawal of the exceedance (delay after withdrawal). The corresponding time is set with the "Delay time" setting. With the setting "00:00:00", switching is always direct.

The following table shows the associated communication objects:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| 16 | Channel A - Load exceedance | 1 Bit <br> 1 Byte | Output object for monitoring the load <br> exceedance. <br> DPT depending on the parameter setting |

[^29]
### 4.9.15.2 Monitoring of load undercut

After activating the parameter, the following selection options are available:

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Value for undercut | $\begin{gathered} 0 \ldots 4600 \mathrm{~W} \\ {[5]} \end{gathered}$ | Setting of the threshold for undercutting |
| Send value if undercut | - not active <br> - value „1" <br> - value „0" | Setting the value to be sent when the switching threshold is undercut. Only with „Output: Switch". |
| Send scene if undercut | not active $1-64$ <br> [1] | Setting of the scene to be sent when the switching threshold is undercut. Only with „Output: Scene". |
| Send output cyclically | not active $1 \mathrm{~min}-24 h$ | Setting at which intervals the value or scene is to be sent. |
| Switch off channel | - not active <br> - active | Setting whether the channel should switch off when the threshold is undercut. |
| Value for withdrawal | $\begin{gathered} 0 \ldots 4600 \mathrm{~W} \\ {[100]} \end{gathered}$ | Setting the threshold for the withdrawal of the undercut |
| Send value on withdrawal | - not active <br> - value „1" <br> - value „0" | Setting of the value to be sent when the withdrawal threshold is exceeded. <br> Only with „Output: Switch". |
| Send scene on withdrawal | not active $1-64$ <br> [2] | Setting of the scene to be sent when the withdrawal threshold is exceeded. <br> Only with „Output: Scene". |
| Type of delay | - Delay after activation <br> - Delay after withdrawal | Setting to which function the delay should apply. |
| Delay time | $\begin{gathered} \text { 00:00:00 ... 08:00:00 hh:mm:ss } \\ {[00: 00: 00]} \end{gathered}$ | Entering a time by which the selected type is to be sent delayed. |

Table 92: Settings - Monitoring of load undercut
When the value falls below the individual "Value for undercut", the output object sends - depending on the setting - either the corresponding 1 Bit value or the desired scene number.

When the individual "Value for withdrawal" is exceeded, the output object sends - depending on the setting - either the corresponding 1 Bit value or the desired scene number.

Important: The value for withdrawal must be greater than the value for undercut!

The parameter "Switch off channel" can be used to set whether this should switch off when falling below the threshold. After switching off, the channel must be reactivated via the object.

Via the setting "Type of delay" it is possible to activate a switching delay either for the undercut (delay after activation) or for the withdrawal of the undercut (delay after withdrawal). The corresponding time is set with the "Delay time" setting. With the setting "00:00:00", switching is always direct.

The following table shows the associated communication objects:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| 17 | Channel A - Load undercut | 1 Bit <br> 1 Byte | Output object for monitoring of load undercut. <br> DPT depending on the parameter setting |

Table 93: Communication objects - Load undercut

### 4.9.15.3 Extended power measurement

After activating the parameter in the channel, the following setting options are available:

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Object selection | - Apparent power in VA (DPT 14.056) <br> - Apparent power in kVA (DPT 9.024) <br> - Reactive power in Var (DPT 14.056) <br> - Reactive power in $k \operatorname{Var}$ (DPT 9.024) <br> - Power factor in cos Phi (DPT 14.057) | Setting of the object type that is to be output additionally. |
| Send value on change of ... | not active, $5 \%-75 \%$ [10 \%] | Setting from which percentage change the value is to be sent. |
| Send cyclically every ... | not active $1 \min -24 h$ | Setting at which intervals the value is to be sent. |

Table 94: Settings - Extended power measurement
With "Object selection", in addition to the active power, another "power" or the "power factor cos Phi" can be output via an object. It can be selected for the apparent power and the reactive power whether it is a 2 Byte or a 4 Byte object.

The parameters "Send value on change of ..." and "Send cyclically every ..." can also be used to define send conditions.

The following table shows the associated communication objects:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| 15 | Channel A - <br> Extended power measurement: <br> Apparent power / Reactive power / <br> Power factor cos Phi | 2 Byte <br> 4 Byte | Output object for the measured value. <br> DPT depending on the parameter setting. |

[^30]TECHNOLOGIES

### 4.9.16 Current measurement

The menu is displayed as soon as the "Current measurement" parameter has been activated in the channel.

The following table shows the settings:

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Object selection | 2 Byte value in mA (DPT 7.012) <br> - 2 Byte floating value in mA (DPT 9.021) <br> - 4 Byte floating value in A (DPT 14.019) | Selection of the datapoint type for the output object of the current measurement. |
| Send value on change of ... | not active, $5 \%-75 \%$ [10 \%] | Setting from which percentage change the value is to be sent. |
| Minimum change | not active $10 \mathrm{~mA}-1 \mathrm{~A}$ | Value by which the value to be sent must change at least. <br> Only if change in \% is active. |
| Send cyclically every ... | not active <br> 1 min - 24 h | Setting at which intervals the value is to be sent. |
| Monitoring of current exceedance | - not active <br> - active, Output: Switch <br> - active, Output: Scene | Activation of the current exceedance and selection of the output object. A detailed description follows in chapter 4.9.16.1 |
| Monitoring of current undercut | - not active <br> - active, Output: Switch <br> - active, Output: Scene | Activation of the current undercut and selection of the output object.. <br> A detailed description follows in chapter 4.9.16.2 |
| Error message | - not active <br> - Load failure with closed contact <br> - Residual current with open contact <br> - Residual current / Load failure | Selection in which error case a 1 Bit telegram is to be sent. |
| Threshold | $\begin{gathered} 20 \mathrm{~mA}-2 \mathrm{~A} \\ {[20 \mathrm{~mA}]} \end{gathered}$ | Setting of the threshold value for sending an error message. <br> Only displayed if "Error message" is active. |

[^31]TECHNOLOGIES

The datapoint type for the output object is defined via the "Object selection".
The setting "Include channel in total current" can be used to determine whether the channel should be added when calculating the total current for the actuator.
It can also be determined at which change a value is to be sent. In order not to send too often for smaller measured values, a value can be defined subsequently by which the measured value must change at least.
The parameter "Send cyclically every ..." is used to set a fixed send interval independent of the measured value.

The parameters for "Monitoring of current exceedance", "Monitoring of current undercut" and "Error message" are explained in the following chapters.

## Error message

## Load failure with closed contact:

If the set threshold is fallen below when the contact is closed, the "Load failure" output object sends a " 1 ". Exceedance again resets the value to " 0 ".

## Residual current with open contact:

If the actuator measures a current greater than the set threshold when the contact is open, the "Residual current" output object sends a "1".

Residual current / Load failure:
The output object "Residual current / Load failure" sends a " 1 " in both error cases.

The following table shows the associated communication objects:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| 13 | Channel A - Current value | 2 Byte <br> 4 Byte | Output of the currently measured value. <br> DPT depending on the parameter setting. |
| 34 | Channel A - Load failure | 1 Bit | Output object for the error message in the <br> event of a load failure. |
| 34 | Channel A - Residual current | 1 Bit | Output object for the error message in the <br> event of a residual current. |
| 34 | Channel A - <br> Residual current / Load failure | 1 Bit | Output object for the error message in case <br> of residual current and load failure. |

[^32]
### 4.9.16.1 Monitoring of current exceedance

After activating the parameter, the following settings are available:

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Value range | $\begin{aligned} & -\quad 10 \mathrm{~mA}-1000 \mathrm{~mA} \\ & -\quad 1 \mathrm{~A}-20 \mathrm{~A} \end{aligned}$ | Preselection and limitation of the value range of the exceedance. |
| Value for exceedance | $\begin{gathered} 10 \ldots 1000 \mathrm{~mA}[10] \\ 1 \ldots 20 \mathrm{~A}[1] \end{gathered}$ | Setting of the threshold for exceeding. Unit depends on the set value range. |
| Send value if exceeded | - not active <br> - value „1" <br> - value „0" | Setting the value to be sent when the switching threshold is exceeded. Only with „Output: Switch". |
| Send scene if exceeded | not active $1-64$ <br> [1] | Setting of the scene to be sent when the switching threshold is exceeded. <br> Only with „Output: Scene". |
| Send output cyclically | not active $1 \min -24 h$ | Setting at which intervals the value or scene is to be sent. |
| Switch off channel | - not active <br> - active | Setting whether the channel should switch off when the threshold is exceeded. |
| Value range for withdrawal | $\begin{aligned} & \text { - } 10 \mathrm{~mA}-1000 \mathrm{~mA} \\ & -\quad 1 \mathrm{~A}-20 \mathrm{~A} \end{aligned}$ | Preselection and limitation of the value range for withdrawal of exceedance. |
| Value for withdrawal | $\begin{gathered} 10 \ldots 1000 \mathrm{~mA}[10] \\ 1 \ldots 20 \mathrm{~A}[1] \end{gathered}$ | Setting the threshold for the withdrawal of the exceedance. <br> Unit depends on the set value range. |
| Send value on withdrawal | - not active <br> - value „1" <br> - value „0" | Setting the value to be sent when falling below the withdrawal threshold. <br> Only with „Output: Switch". |
| Send scene on withdrawal | not active 1-64 <br> [2] | Setting the scene to be sent when falling below the withdrawal threshold. <br> Only with „Output: Scene". |
| Type of delay | - Delay after activation <br> - Delay after withdrawal | Setting to which function the delay should apply. |
| Delay time | $\begin{gathered} \text { 00:00:00 ... 08:00:00 hh:mm:ss } \\ {[00: 00: 00]} \end{gathered}$ | Entering a time by which the selected type is to be sent delayed. |

[^33]By means of the parameters "Value range" and "Value range for withdrawal", the respective setting range of the threshold is adapted to the current value to be expected.

When the individual "Value for exceedance" is overshot, the output object sends - depending on the setting - either a corresponding 1 Bit value or the desired scene number.

When falling below the individual "Value for withdrawal", the output object sends - depending on the setting - either a corresponding 1 Bit value or the desired scene number.
Important: The value for withdrawal must be smaller than the value for exceedance!
The parameter "Switch off channel" can be used to set whether this should switch off when the threshold is exceeded. After switching off, the channel must be reactivated via object.

Via the setting "Type of delay" it is possible to activate a switching delay either for the exceedance (delay after activation) or for the withdrawal of the exceedance (delay after withdrawal). The corresponding time is set with the "Delay time" setting. With the setting "00:00:00", switching is always direct.

The following table shows the associated communication objects:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| 18 | Channel A - <br> Current exceedance | 1 Bit <br> 1 Byte | Output object for monitoring the current <br> exceedance. <br> DPT depending on the parameter setting |

[^34]
### 4.9.16.2 Monitoring of current undercut

After activating the parameter, the following settings are available:

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Value range | $\begin{aligned} & \text { - } 10 \mathrm{~mA}-1000 \mathrm{~mA} \\ & -\quad 1 \mathrm{~A}-20 \mathrm{~A} \end{aligned}$ | Preselection and limitation of the undercut value range. |
| Value for undercut | $\begin{gathered} 10 \ldots 1000 \mathrm{~mA}[10] \\ 1 \text {... } 20 \mathrm{~A}[1] \end{gathered}$ | Setting of the threshold for undercutting. Unit depends on the set value range. |
| Send value if undercut | - not active <br> - value „1" <br> - value „0" | Setting of the value to be sent when falling below the threshold.. <br> Only with „Output: Switch". |
| Send scene if undercut | not active $1-64$ <br> [1] | Setting of the scene to be sent when falling below the threshold. Only with „Output: Scene". |
| Send output cyclically | not active <br> 1 min - 24 h | Setting at which intervals the value or scene is to be sent. |
| Switch off channel | - not active <br> - active | Setting whether the channel should switch off when the threshold is undercut. |
| Value range for withdrawal | $\begin{aligned} & \text { - } \quad 10 \mathrm{~mA}-1000 \mathrm{~mA} \\ & -\quad 1 \mathrm{~A}-20 \mathrm{~A} \end{aligned}$ | Preselection and limitation of the range of values for the withdrawal of the undercut. |
| Value for withdrawal | $\begin{gathered} 10 \ldots 1000 \mathrm{~mA}[10] \\ 1 \ldots 20 \mathrm{~A}[1] \end{gathered}$ | Setting the threshold for the withdrawal of the undercut. <br> Unit depends on the set value range. |
| Send value on withdrawal | - not active <br> - value „1" <br> - value „0" | Setting of the value to be sent when the withdrawal threshold is exceeded. <br> Only with „Output: Switch". |
| Send scene on withdrawal | not active $1-64$ <br> [2] | Setting of the scene to be sent when the withdrawal threshold is exceeded. <br> Only with „Output: Scene". |
| Type of delay | - Delay after activation <br> - Delay after withdrawal | Setting to which function the delay should apply. |
| Delay time | $\begin{gathered} \text { 00:00:00 ... 08:00:00 hh:mm:ss } \\ {[00: 00: 00]} \end{gathered}$ | Entering a time by which the selected type is to be sent delayed. |

[^35]By means of the parameters "Value range" and "Value range for withdrawal", the respective setting range of the threshold is adapted to the current value to be expected.

When the value falls below the individual "Value for undercut", the output object sends - depending on the setting - either the corresponding 1 Bit value or the desired scene number.

When the individual "Value for withdrawal" is exceeded, the output object sends - depending on the setting - either the corresponding 1 Bit value or the desired scene number.

Important: The value for withdrawal must be greater than the value for undercut!
The parameter "Switch off channel" can be used to set whether this should switch off when falling below the threshold. After switching off, the channel must be reactivated via the object.

Via the setting "Type of delay" it is possible to activate a switching delay either for the undercut (delay after activation) or for the withdrawal of the undercut (delay after withdrawal). The corresponding time is set with the "Delay time" setting. With the setting "00:00:00", switching is always direct.

The following table shows the associated communication objects:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| 19 | Channel A - Current undercut | 1 Bit <br> 1 Byte | Output object for monitoring of current <br> undercut. <br> DPT depending on the parameter setting |

Table 101: Communication objects - Current undercut

### 4.9.17 Voltage measurement

The menu is displayed as soon as the "Voltage measurement" parameter has been activated in the channel.

The following table shows the settings:

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Send value on change of ... | not active, $5 \%-75 \%$ [10 \%] | Setting from which percentage change the value is to be sent. |
| Send cyclically every ... | not active $1 \mathrm{~min}-24 h$ | Setting at which intervals the value is to be sent. |
| Monitoring of voltage exceedance | - not active <br> - active, Output: Switch <br> - active, Output: Scene | Activation of the voltage exceedance and selection of the output object. A detailed description follows in chapter 4.9.17.1 |
| Monitoring of voltage undercut | - not active <br> - active, Output: Switch <br> - active, Output: Scene | Activation of the voltage undercut and selection of the output object.. A detailed description follows in chapter 4.9.17.2 |

Table 102: Settings - Voltage measurement
With activation, the actual voltage value at the channel is measured.
The sending conditions for the measured value can be set. On the one hand, it can be defined at which change a value is to be sent, on the other hand, a fixed sending interval can be determined with the parameter "Send cyclically every ..." independent of the measured value.

The parameters for "Monitoring of voltage exceedance" and "Monitoring of voltage undercut" are explained in the following chapters.

The following table shows the associated communication objects:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| 14 | Channel A - Voltage value | 4 Byte | Output of the currently measured value. |

Table 103: Communication object - Voltage measurement

### 4.9.17.1 Monitoring of voltage exceedance

After activating the parameter, the following settings are available:

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Value for exceedance | $\begin{gathered} 180 \ldots 300 \mathrm{~V} \\ {[260 \mathrm{~V}]} \end{gathered}$ | Setting of the threshold for exceeding. |
| Send value if exceeded | - not active <br> - value „1" <br> - value „0" | Setting the value to be sent when the switching threshold is exceeded. <br> Only with „Output: Switch". |
| Send scene if exceeded | not active $1-64$ <br> [1] | Setting of the scene to be sent when the switching threshold is exceeded. Only with „Output: Scene". |
| Send output cyclically | not active $1 \mathrm{~min}-24 \mathrm{~h}$ | Setting at which intervals the value or scene is to be sent. |
| Switch off channel | - not active <br> - active | Setting whether the channel should switch off when the threshold is exceeded. |
| Value for withdrawal | $\begin{gathered} 180 \ldots 300 \mathrm{~V} \\ {[240 \mathrm{~V}]} \end{gathered}$ | Setting the threshold for the withdrawal of the exceedance. |
| Send value on withdrawal | - not active <br> - value „1" <br> - value „0" | Setting the value to be sent when falling below the withdrawal threshold. Only with „Output: Switch". |
| Send scene on withdrawal | not active 1-64 <br> [2] | Setting the scene to be sent when falling below the withdrawal threshold. <br> Only with „Output: Scene". |
| Type of delay | - Delay after activation <br> - Delay after withdrawal | Setting to which function the delay should apply. |
| Delay time | $\begin{gathered} \text { 00:00:00 ... 08:00:00 hh:mm:ss } \\ {[00: 00: 00]} \end{gathered}$ | Entering a time by which the selected type is to be sent delayed. |

Table 104: Settings - Monitoring of voltage exceedance
When the individual "Value for exceedance" is overshot, the output object sends - depending on the setting - either a corresponding 1 Bit value or the desired scene number.

When falling below the individual "Value for withdrawal", the output object sends - depending on the setting - either a corresponding 1 Bit value or the desired scene number.

Important: The value for withdrawal must be smaller than the value for exceedance!

TECHNOLOGIES

The parameter "Switch off channel" can be used to set whether this should switch off when the threshold is exceeded. After switching off, the channel must be reactivated via object.

Via the setting "Type of delay" it is possible to activate a switching delay either for the exceedance (delay after activation) or for the withdrawal of the exceedance (delay after withdrawal). The corresponding time is set with the "Delay time" setting. With the setting "00:00:00", switching is always direct.

The following table shows the associated communication objects:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| 20 | Channel A - <br> Voltage exceedance | 1 Bit <br> 1 Byte | Output object for monitoring the voltage <br> exceedance. <br> DPT depending on the parameter setting |

[^36]
### 4.9.17.2 Monitoring of voltage undercut

After activating the parameter, the following settings are available:

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Value for undercut | $\begin{gathered} 180 \ldots 300 \mathrm{~V} \\ {[210 \mathrm{~V}]} \end{gathered}$ | Setting of the threshold for undercutting |
| Send value if undercut | - not active <br> - value „1" <br> - value „0" | Setting of the value to be sent when falling below the threshold.. <br> Only with „Output: Switch". |
| Send scene if undercut | not active $1-64$ <br> [1] | Setting of the scene to be sent when falling below the threshold. Only with „Output: Scene". |
| Send output cyclically | not active $1 \mathrm{~min}-24 \mathrm{~h}$ | Setting at which intervals the value or scene is to be sent. |
| Switch off channel | - not active <br> - active | Setting whether the channel should switch off when the threshold is undercut. |
| Value for withdrawal | $\begin{gathered} 180 \ldots 300 \mathrm{~V} \\ {[230 \mathrm{~V}]} \end{gathered}$ | Setting the threshold for the withdrawal of the undercut. |
| Send value on withdrawal | - not active <br> - value „1" <br> - value „0" | Setting of the value to be sent when the withdrawal threshold is exceeded. <br> Only with „Output: Switch". |
| Send scene on withdrawal | not active 1-64 <br> [2] | Setting of the scene to be sent when the withdrawal threshold is exceeded. <br> Only with „Output: Scene". |
| Type of delay | - Delay after activation Delay after withdrawal | Setting to which function the delay should apply. |
| Delay time | $\begin{gathered} \text { 00:00:00 ... 08:00:00 hh:mm:ss } \\ {[00: 00: 00]} \end{gathered}$ | Entering a time by which the selected type is to be sent delayed. |

Table 106: Settings - Monitoring of voltage undercut
When the value falls below the individual "Value for undercut", the output object sends - depending on the setting - either the corresponding 1 Bit value or the desired scene number.

When the individual "Value for withdrawal" is exceeded, the output object sends - depending on the setting - either the corresponding 1 Bit value or the desired scene number.
Important: The value for withdrawal must be greater than the value for undercut!

The parameter "Switch off channel" can be used to set whether this should switch off when falling below the threshold. After switching off, the channel must be reactivated via the object.

Via the setting "Type of delay" it is possible to activate a switching delay either for the undercut (delay after activation) or for the withdrawal of the undercut (delay after withdrawal). The corresponding time is set with the "Delay time" setting. With the setting "00:00:00", switching is always direct.

The following table shows the associated communication objects:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| 21 | Channel A - Voltage undercut | 1 Bit <br> 1 Byte | Output object for monitoring of voltage <br> undercut. <br> DPT depending on the parameter setting |

[^37]
### 4.9.18 Energy and cost meter

The menu is displayed as soon as the parameter "Energy and cost meter" has been activated in the channel.

The following table shows the selection options:

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Main meter (is automatically active) |  |  |
| Object selection (from HW R4.2) | - Value in Wh (DPT 13.010) <br> - Value in kWh (DPT 13.013) | Selection of the datapoint type for the main meter. |
| Send meter reading on change | - not active <br> - active | Setting whether the meter reading should be sent when changed. |
| Send meter reading every ... | $\begin{gathered} 10-50000 \mathrm{~Wh} \\ {[10 \mathrm{~Wh}]} \\ 1 \ldots 65535 \mathrm{kWh} \\ {[1 \mathrm{kWh}]} \end{gathered}$ | Setting for which change the meter reading is to be sent. <br> Selection depends on the selected datapoint type. |
| Send meter reading cyclically every ... | $\begin{aligned} & \text { not active } \\ & 1 \mathrm{~min}-24 \mathrm{~h} \\ & {[5 \mathrm{~min}]} \end{aligned}$ | Setting whether and at what interval the meter reading is to be sent cyclically. |
| Intermediate meter |  |  |
| Intermediate meter | - not active <br> - active | Activation of the intermediate meter. |
| Object selection | - Value in Wh (DPT 13.010) <br> - Value in kWh (DPT 13.013) | Selection of the datapoint type for the intermediate meter. |
| Send meter reading on change | - not active <br> - active | Setting whether the meter reading should be sent when changed. |
| Send meter reading every ... | $\begin{aligned} & 10-50000 \mathrm{~Wh} \\ & \quad[10 \mathrm{~Wh}] \\ & 1 \ldots 65535 \mathrm{kWh} \\ & \quad[1 \mathrm{kWh}] \end{aligned}$ | Setting for which change the meter reading is to be sent. <br> Selection depends on the selected datapoint type. |
| Send meter reading cyclically every ... | not active $1 \mathrm{~min}-24 h$ | Setting whether and at what interval the meter reading is to be sent cyclically. |
| Cost meter (Settings are the same for main and intermediate meter) |  |  |
| Cost meter | - not active <br> - active | Activation of the cost meter. |
| Send meter reading on change | - not active <br> - active | Setting whether the meter reading should be sent when changed. |

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Send meter reading every ... | $\begin{gathered} 1 \ldots 255 € \\ {[100 €]} \\ {[10 €]} \end{gathered}$ | Setting for which change the meter reading is to be sent. Different default values: main and Intermediate meter. |
| Send meter reading cyclically every ... | $\begin{aligned} & \text { not active } \\ & 1 \mathrm{~min}-24 \mathrm{~h} \\ & \text { [1 h] } \end{aligned}$ | Setting whether and at what interval the meter reading is to be sent cyclically. |
| Event A / Event B |  |  |
| Activate Event A/B with | - not active <br> - final value: intermediate meter <br> - final value: main meter <br> - final value: costs intermediate meter <br> - final value: costs main meter <br> - time <br> - interval | Determination of the action with which an event is to be activated. |
| Final value | $\begin{gathered} 1 \ldots 4294967295 € \\ {[200]} \end{gathered}$ | Value from which the event is to be activated. <br> Only with "final value: costs ...". |
| Final value | 1 ... 4294967295 kWh/Wh [200] | Value from which the event is to be activated. <br> Visible when "final value ..." is selected. <br> DPT for main meter is "kWh". <br> DPT for intermediate meter depends on the "Object selection" parameter |
| Hours | $\begin{gathered} 0 \ldots 23 \\ {[0]} \end{gathered}$ | Specify the time or interval at which the |
| Minutes | $\begin{gathered} 0 \ldots 59 \\ {[0]} \end{gathered}$ | If "time" or "interval" is selected |
| Day | - every day <br> - Monday <br> - Tuesday <br> - Wednesday <br> - Thursday <br> - Friday <br> - Saturday <br> - Sunday <br> - every working day <br> - every weekend day | Setting on which day(s) the event is to be activated. <br> Visible when "time" is selected. |

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Object „Event A" / "Event B" sends | - OFF <br> - ON | Value to be sent when the condition for triggering the event is met. |
| Intermediate meter: Send all values | - not active <br> - active | Settings for which additional actions are to be carried out when the condition for activating the event is fulfilled. <br> The number of possible actions depends on the selection "Activate event $X$ with". |
| Intermediate meter: Send costs | - not active <br> - active |  |
| Intermediate meter: <br> Reset | - not active <br> - active |  |
| Main meter: Send all values | - not active <br> - active |  |
| Main meter: Send costs | - not active <br> - active |  |
| Main meter: Reset | - not active <br> - active |  |

Table 108: Settings - Energy and cost meter

## Main meter / Intermediate meter

The parameter "Object selection" can be used to set the datapoint type of the main and intermediate meters independently (Wh or kWh).
Important: The selection at the main meter requires the units HW R4.2!
The setting "Send meter reading on change" can be used to set at which change the meter sends its actual meter reading. If the setting is "not active", the meter does not send a value, no matter how big the change is.

The setting "Send meter reading cyclically every ..." can be used to set the intervals at which the device sends its actual measured value. The cyclical sending function can be activated or deactivated independently of the setting "Send meter reading on change". Values are also sent if the meter has not recorded a change. If both parameters are deactivated, no value is ever sent..

## Cost meter

Here, sending conditions for the meter reading can be set for both the main and intermediate meters. The settings correspond to the settings for the main and intermediate meters.

Important: If the parameter "Separate Day/Night meters" in the menu "Cost calculation" is active, the objects "Intermediate meter: Electric active energy ( 24 h )" and "Main meter: Electric active energy ( 24 h )" are not writable!

## Event A / Event B

Two different events can be triggered if certain conditions are met. This is done via 1 Bit objects. In addition to sending the object (Event A or Event B), other actions can be performed. These can be activated individually as required:

## final value: intermediate/main meter

Event is activated with a fixed value
final value: costs intermediate/main meter
Event is activated when a certain cost level is reached.

## time

Event is executed recurrently at a certain time. In addition to hours and minutes, it is also possible to set whether the event is to be activated on certain days.

## interval

Event is activated recurrently at a defined interval (in hours and minutes).
Important: The starting point and subsequent cyclical transmission repetition is always after reprogramming or when the bus voltage returns!

The following table shows the associated communication objects:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| 22 | Channel A - Intermediate meter: <br> Electrical active energy (24 h) | 4 Byte | Sending the meter reading. <br> DPT depending on setting |
| 23 | Channel A - Intermediate meter: Costs <br> in Cent /Euro - Output | 2 Byte <br> 4 Byte | Sending the actual costs. DPT according <br> to setting in "Cost calculation" |
| 24 | Channel A - Intermediate meter: <br> Meter reading "Day" | 4 Byte | Sending the meter reading |
| 25 | Channel A - Intermediate meter: <br> Meter reading "Night" | 4 Byte | Sending the meter reading |
| 26 | Channel A - Intermediate meter: Reset | 1 Bit | Resetting the intermediate meter |
| 27 | Channel A - Main meter: <br> Electrical active energy (24 h) | 4 Byte | Sending the meter reading |
| Channel A - Main meter: Costs in Cent / <br> Euro - Output | 2 Byte | Sending the actual costs. DPT according <br> to setting in "Cost calculation" |  |
| 29 | Channel A - Main meter: <br> Meter reading "Day" | 4 Byte | Sending the meter reading |
| 30 | Channel A - Main meter: <br> Meter reading "Night" | 4 Byte | Sending the meter reading |
| 31 | Channel A - Main meter: Reset | 1 Bit | Resetting the main meter |
| 32 | Channel A - Meter: Event A | 1 Bit | Sending the value of Event A |
| 33 | Channel A - Meter: Event B | 1 Bit | Sending the value of Event B |

Table 109: Communication objects - Energy and cost meter

TECHNOLOGIES

### 4.10 Switch pulse

If a channel is selected for the "Switch pulse" function, the corresponding menu appears
The individual settings are described in the following chapters.
Information on "Description of channel/objects" and "Additional text", see 4.7 Identical settings: Description of channel/objects + Additional text

### 4.10.1 Relay operating mode

The table shows the possible settings:

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :--- | :--- | :--- | :--- |
| Mode | normally open <br> ■ normally closed | Relay operating mode of the respective <br> channel. |

Table 110: Settings - Relay operating mode
The "Mode" determines whether a relay is operated as a "normally open" or "normally closed" contact. This means whether the relay is activated with a " 1 " or with a " 0 ".

Important note: The green channel indicator LED on the actuator reflects the status of the status object (" 1 " = LED On, "0" = LED Off). It does not reflect the state of the relay contact, whether open or closed (important when configured as a "normally closed").
The following diagram shows the behaviour of a relay - in the operating mode as a "normally open" contact or as a "normally closed" contact - in response to a KNX telegram:

[^38]
### 4.10.2 Switch pulse

The table shows the possible settings:

| ETS Text | Dynamic Range <br> [Default value] | Comment |
| :---: | :---: | :--- |
| Pulse time | $300 \mathrm{~ms}-30 \mathrm{~s}$ <br> $[500 \mathrm{~ms}]$ | Setting the duration of the pulse. |
| Repeat pulse signal once | not active <br> active | Setting whether the pulse should be <br> repeated once more. |
| Time until the next pulse | $0,5 \mathrm{~s}-30 \mathrm{~s}$ <br> $[0,5 \mathrm{~s}]$ | Setting the duration between the first and <br> the second pulse. <br> Only shown if "Repeat pulse signal <br> once" is active. |

Table 111: Settings - Switch pulse
Can be used e.g. for a bell. By sending a " 1 " to the object "Switch pulse", the bell is activated for 0.5 s , for example. After a set delay, the bell is activated a second time for the same pulse time. Thus the bell rings twice.

The following table shows the communication object:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| 1 | Channel A - Switch pulse | 1 Bit | Starting the pulse |

Table 112: Communication object - Switch pulse

TECHNOLOGIES

### 4.10.3 Behaviour on locking / unlocking

The table shows the possible settings:

| ETS Text | Dynamic range <br> [Default value] | Comment |
| :---: | :---: | :---: |
| Behaviour on locking | - OFF <br> - no change | Setting for how the channel should behave when a lock is set. |
| Behaviour on unlocking | - OFF <br> - switch pulse | Setting for how the channel should behave when it is unlocked. |

Table 113: Setting - Behaviour on locking / unlocking
If a channel is locked by sending a " 1 " to the lock object, the channel is locked for further operation until it is unlocked again by sending a "0" to the lock object.

The following actions can be executed when locking and unlocking:

- OFF

The channel is switched off.

- no change (only for "locking")

The channel retains the current state.

- switch pulse (only for "unlocking")

The channel triggers the switch pulse.

The following table shows the communication object:

| Number | Name / Object function | Length | Usage |
| :--- | :--- | :--- | :--- |
| 4 | Channel A - Lock | 1 Bit | Activates / deactivates a lock |

Table 114: Communication object - Lock object

## 6 Appendix

### 6.1 Statutory requirements

The devices described above must not be used in conjunction with devices which directly or indirectly serve human, health, or life-safety purposes. Furthermore, the devices described must not be used if their use may cause danger to people, animals, or property.
Do not leave the packaging material carelessly lying around. Plastic foils/ bags etc. can become a dangerous toy for children.

### 6.2 Disposal

Do not dispose of the old devices in the household waste. The device contains electrical components that must be disposed of as electronic waste. The housing is made of recyclable plastic.

### 6.3 Assembly

## Danger to life from electric current!

All work on the unit may only be carried out by qualified electricians. The country-specific regulations and the applicable KNX guidelines must be observed.

The devices are approved for operation in the European Union and in the United Kingdom. The products are respectively marked with the CE and UKCA symbols.

Use in the USA and Canada is prohibited!
Before starting work on the device, always disconnect it from the power supply by turning off the circuit breaker or removing the fuse. After installation, all live terminals and connections must be completely covered by the control panel cover to prevent accidental contact. It must be ensured that the control panel cover may not be opened without tools.
